PEARSON
## About this book

### Chapter 1: Logarithmic functions and indices
1. Rules of indices  
2. Surds  
3. Writing an expression as a logarithm  
4. Laws of logarithms  
5. The change of base formulae to solve equations  
6. The functions $y = a^x$ and $y = \log_b x$

### Chapter 2: The quadratic function
1. Factorising quadratic expressions  
2. Completing the square of quadratic expressions  
3. Solving quadratic equations  
4. Solving quadratic equations by using formulae  
5. Functions of the roots of a quadratic equation

### Chapter 3: Identities and inequalities
1. Dividing a polynomial  
2. Factorising a polynomial  
3. The remainder theorem  
4. The substitution method  
5. Solving linear inequalities  
6. Solving quadratic inequalities  
7. Representing linear inequalities graphically and simple linear programming problems

### Chapter 4: Graphs and functions
1. Sketching cubic curves  
2. Sketching graphs of cubic functions  
3. Sketching the reciprocal function  
4. Sketching curves of functions  
5. Sketching more complicated curves  
6. Sketching the graph of exponential functions  
7. Using graphs of functions to solve equations

### Chapter 5: Series
1. Arithmetic sequences  
2. Adding the terms of an arithmetic sequence  
3. Finding the sum of an arithmetic series  
4. $\sum$ to signify 'the sum of'  
5. Geometric sequences

Chapter 10: Trigonometry

10.1 You use cosine and sine in relation.

In our previous lesson today we worked with angles in degrees, whereas today we are going to work with angles in radians. Remember that we use radians to measure the size of an angle. This is because radians are used in many mathematical formulas.

- If the arc length is 60°, then the angle is 1 radian. If the arc length is 120°, then the angle is 2 radians. If the arc length is 180°, then the angle is 3 radians.

A circle is a shape with all sides of equal length. A circle has a radius at the centre of the circle. The angle at the centre of a circle is called a central angle. The angle at the circumference of a circle is called an inscribed angle.

- Example 1: Answer the following inscribed angle.

\[ \angle \text{inscribed} = \angle \text{central} \]

\[ \frac{\text{inscribed}}{\text{central}} = \frac{\text{radius}}{\text{radius}} = \frac{1}{1} = 1 \]

- Example 2: Answer the following central angle.

\[ \angle \text{central} = \angle \text{inscribed} \times \frac{\text{radius}}{\text{radius}} = \frac{1}{1} = 1 \]

Chapter 10: Summary

1. The sine of an angle is defined as the ratio of the length of the opposite side to the length of the hypotenuse: \[ \sin \theta = \frac{\text{opposite}}{\text{hypotenuse}} \]
2. The cosine of an angle is defined as the ratio of the length of the adjacent side to the length of the hypotenuse: \[ \cos \theta = \frac{\text{adjacent}}{\text{hypotenuse}} \]
3. The tangent of an angle is defined as the ratio of the length of the opposite side to the length of the adjacent side: \[ \tan \theta = \frac{\text{opposite}}{\text{adjacent}} \]
4. The sine of a right angle is 1: \[ \sin 90^\circ = 1 \]
5. The cosine of a right angle is 0: \[ \cos 90^\circ = 0 \]
6. The tangent of a right angle is undefined: \[ \tan 90^\circ \text{ is undefined} \]
7. The sine of any angle is positive: \[ \sin \theta > 0 \]
8. The cosine of any angle is negative: \[ \cos \theta < 0 \]
9. The tangent of any angle is positive: \[ \tan \theta > 0 \]
10. \[ \sin^2 \theta + \cos^2 \theta = 1 \]

Mathematical formulae

All the formulae needed for the International GCSE examinations have been covered.

Worked examples

When a new topic is introduced, worked examples take a typical question and show you step-by-step how to answer it.

Clear diagrams

Graphs and technical diagrams support the text to illustrate a formula or pose a question for you to answer.

Hint boxes

These either provide help on how to tackle a question, or information relating to the topic.

Chapter summaries

The key points are summarised at the end of every chapter. Check you understand them all fully before moving on. The summaries are also useful for revision.
Chapter 1: Logarithmic functions and indices

1.1 You can simplify expressions by using rules of indices

\[ a^m \times a^n = a^{m+n} \]
\[ a^m \div a^n = a^{m-n} \]
\[ (a^m)^n = a^{mn} \]
\[ a^{-m} = \frac{1}{a^m} \]
\[ a^{\frac{1}{n}} = \sqrt[n]{a} \] \hspace{1cm} \textbf{Hint:} The \( n \)th root of \( a \).
\[ a^{\frac{m}{n}} = \sqrt[n]{a^m} \]

Example 1

Simplify these expressions:

\begin{align*}
\text{a} & \quad x^2 \times x^5 \\
\text{b} & \quad 2r^2 \times 3r^3 \\
\text{c} & \quad b^4 \div b^4 \\
\text{d} & \quad 6x^{-3} + 3x^{-5} \\
\text{e} & \quad (a^3)^2 \times 2a^2 \\
\text{f} & \quad (3x^2)^3 \div x^4
\end{align*}

\begin{align*}
\text{a} & \quad x^2 \times x^5 \\
 & = x^{2+5} \\
 & = x^7 \\
& \text{Use the rule } a^m \times a^n = a^{m+n} \text{ to simplify the index.}

\text{b} & \quad 2r^2 \times 3r^3 \\
 & = 2 \times 3 \times r^2 \times r^3 \\
 & = 6r^2 \times r^3 \\
 & = 6r^5 \\
& \text{Rewrite the expression with the numbers together and the } r \text{ terms together.}

\text{c} & \quad b^4 \div b^4 \\
 & = b^{4-4} \\
 & = b^0 = 1 \\
& \text{Use the rule } a^m \div a^n = a^{m-n} \text{ to simplify the index.}

\text{d} & \quad 6x^{-3} + 3x^{-5} \\
 & = 6 \times x^{-3} + x^{-5} \\
 & = 2x^2 \\
 & = 2x^2 \\
& \text{Use the rule } (a^m)^n = a^{mn} \text{ to simplify the index.}

\text{e} & \quad (a^3)^2 \times 2a^2 \\
 & = a^6 \times 2a^2 \\
 & = 2 \times a^6 \times a^2 \\
 & = 2 \times a^{6+2} \\
 & = 2a^8 \\
& \text{Use the rule } (a^m)^n = a^{mn} \text{ to simplify the index.}

\text{f} & \quad (3x^2)^3 \div x^4 \\
 & = 27x^6 \div x^4 \\
 & = 27 \times x^{6-4} \\
 & = 27x^2
\end{align*}

</tbody>
</table>
Exercise 1A

Simplify these expressions:

1 a $x^1 \times x^4$  
   c $4p^3 \div 2p$  
   e $k^3 \div k^{-2}$  
   g $10x^5 \div 2x^{-3}$  
   i $(2a^3)^2 - 2a^1$  
   k $2a^{-4} \times 3a^{-5}$  
   m $9x^2 \times 3(x^2)^3$  
   o $7a^4 \times (3a^3)^2$  
   q $2a^3 + 3a^2 \times 6a^5$

   b $2x^3 \times 3x^2$  
   d $3x^{-4} + x^{-2}$  
   f $(y^3)^5$  
   h $(p^3)^2 \div p^4$  
   j $8p^{-4} \div 4p^3$  
   l $21a^3b^2 \div 7ab^4$  
   n $3x^3 \times 2x^2 \times 4x^6$  
   p $(4y^3)^3 \div 2y^1$  
   r $3a^4 \times 2a^5 \times a^3$

2 Simplify:

   a $x^3 + x^{-2}$  
   d $(x^2)^{\frac{1}{2}}$  
   g $9x^\frac{1}{2} + 3x^\frac{1}{3}$  
   b $x^5 + x^7$  
   e $(x^3)^\frac{1}{2}$  
   h $5x^\frac{1}{2} + x^\frac{1}{3}$  
   c $x^\frac{4}{7} \times x^\frac{5}{8}$  
   f $3x^{0.5} \div 4x^{-0.5}$  
   i $3x^4 \times 2x^{-5}$

3 Evaluate:

   a $25^{\frac{3}{2}}$  
   d $4^{-2}$  
   g $(\frac{1}{4})^0$  
   b $81^{\frac{1}{2}}$  
   e $9^{-\frac{1}{2}}$  
   h $1296^{\frac{1}{4}}$  
   c $27^{\frac{1}{3}}$  
   f $(-5)^{-3}$  
   i $\left(1\frac{9}{16}\right)^\frac{1}{2}$  
   j $(\frac{27}{8})^{\frac{1}{3}}$  
   k $(\frac{9}{8})^{-1}$  
   l $(\frac{144}{512})^{-\frac{1}{3}}$

1.2 You can write a number exactly using surds, e.g. $\sqrt{2}$, $\sqrt{3}$, $-5$, $\sqrt{19}$. You cannot evaluate surds exactly because they give never-ending, non-repeating decimal fractions, e.g. $\sqrt{2} = 1.414213562...$

The square root of a prime number is a surd.

- You can manipulate surds using these rules:
  $$\sqrt{ab} = \sqrt{a} \times \sqrt{b}$$
  $$\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}$$

- You can rationalise the denominator of $\frac{1}{\sqrt{a}}$ by multiplying the top and bottom by $\sqrt{a}$. 
Example 4

Simplify:

\( \sqrt{12} \) \hspace{1cm} \frac{\sqrt{20}}{2} \hspace{1cm} 5\sqrt{6} - 2\sqrt{24} + \sqrt{294} \\

\( a \) \quad \sqrt{12} \\
\quad = \sqrt{4 \times 3} \\
\quad = \sqrt{4} \times \sqrt{3} \quad \text{Use the rule } \sqrt{a b} = \sqrt{a} \times \sqrt{b}. \\
\quad = 2 \sqrt{3} \quad \sqrt{4} = 2 \\

\( b \) \quad \frac{\sqrt{20}}{2} \\
\quad = \frac{\sqrt{4 \times 5}}{2} \\
\quad = \frac{2 \sqrt{5}}{2} \quad \text{Cancel by 2.} \\
\quad = \sqrt{5} \\

\( c \) \quad 5\sqrt{6} - 2\sqrt{24} + \sqrt{294} \\
\quad = 5\sqrt{6} - 2\sqrt{6 \times 4} + \sqrt{6 \times 49} \quad \sqrt{6} \text{ is a common factor.} \\
\quad = 5\sqrt{6} - 2\sqrt{6} \times \sqrt{4} + \sqrt{6} \times \sqrt{49} \\
\quad = 6(5 - 2 \times 2 + 7) \quad \text{Work out the square roots } \sqrt{4} \text{ and } \sqrt{49}. \\
\quad = 6(8) \\
\quad = 8\sqrt{6} \\

Example 5

Rationalise the denominator of:

\( a \) \quad \frac{1}{\sqrt{3}} \hspace{1cm} \frac{12}{\sqrt{2}} \\

\( a \) \quad \frac{1}{\sqrt{3}} \\
\quad = \frac{1 \times \sqrt{3}}{\sqrt{3} \times \sqrt{3}} \quad \text{Multiply the top and bottom by } \sqrt{3}. \\
\quad = \frac{\sqrt{3}}{3} \quad \sqrt{3} \times \sqrt{3} = (\sqrt{3})^2 = 3 \\

\( b \) \quad \frac{12}{\sqrt{2}} = \frac{12}{\sqrt{2}} \times \frac{\sqrt{2}}{\sqrt{2}} \quad \text{Multiply the top and bottom by } \sqrt{2}. \\
\quad = \frac{12 \sqrt{2}}{2} \quad \text{Remember } \sqrt{2} \times \sqrt{2} = 2 \\
\quad = 6 \sqrt{2} \quad \text{Simplify your answer}
Exercise 1B

Simplify:

1. \( \sqrt{28} \)
2. \( \sqrt{72} \)
3. \( \sqrt{50} \)
4. \( \sqrt{32} \)
5. \( \sqrt{90} \)
6. \( \sqrt{12} \)
7. \( \sqrt{\frac{27}{3}} \)
8. \( \sqrt{20} + \sqrt{80} \)
9. \( \sqrt{200} + \sqrt{18} - \sqrt{72} \)
10. \( \sqrt{175} + \sqrt{63} + 2\sqrt{28} \)
11. \( 1\sqrt{28} - 2\sqrt{63} + \sqrt{7} \)
12. \( \sqrt{80} - 2\sqrt{20} + 3\sqrt{45} \)
13. \( 3\sqrt{80} - 2\sqrt{20} + 5\sqrt{45} \)
14. \( \frac{\sqrt{44}}{\sqrt{11}} \)
15. \( \sqrt{12} + 3\sqrt{48} + \sqrt{75} \)
16. \( \frac{1}{\sqrt{5}} \)
17. \( \frac{1}{\sqrt{11}} \)
18. \( \frac{1}{\sqrt{2}} \)
19. \( \frac{\sqrt{3}}{\sqrt{15}} \)
20. \( \frac{\sqrt{12}}{\sqrt{48}} \)
21. \( \frac{\sqrt{5}}{\sqrt{80}} \)
22. \( \frac{\sqrt{12}}{\sqrt{156}} \)
23. \( \frac{\sqrt{7}}{\sqrt{63}} \)

1.3 You need to know how to write an expression as a logarithm

- \( \log_a n = x \) means that \( a^x = n \), where \( a \) is called the base of the logarithm.

In the International GCSE the base of the logarithm will always be a positive integer greater than 1.

Example 6

Write as a logarithm \( 2^5 = 32 \).

Here \( a = 2, x = 5, n = 32 \).

\( 2^5 = 32 \)  
Base

So \( \log_2 32 = 5 \)  
Logarithm

In words, you would say '2 to the power 5 equals 32'.

In words, you would say 'the logarithm of 32, to base 2, is 5'.

Example 7

Rewrite as a logarithm:

\( a \quad 10^3 = 1000 \quad b \quad 5^4 = 625 \quad c \quad 2^{10} = 1024 \)

\( a \quad \log_{10} 1000 = 3 \)

\( b \quad \log_5 625 = 4 \)

\( c \quad \log_2 1024 = 10 \)

- \( \log_a 1 = 0 \) Because \( a^0 = 1 \).
- \( \log_a a = 1 \) Because \( a^1 = a \).

**Example 8**
Find the value of

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>( \log_3 81 )</td>
<td>b</td>
</tr>
</tbody>
</table>

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>( \log_3 81 = 4 )</td>
</tr>
<tr>
<td>b</td>
<td>( \log_4 0.25 = -1 )</td>
</tr>
<tr>
<td>c</td>
<td>( \log_5 (a^5) = 5 )</td>
</tr>
</tbody>
</table>

Because \( 3^4 = 81 \).  
Because \( 4^{-1} = \frac{1}{4} = 0.25 \).  
Because \( a^5 = a^5 \)!

You can use the \( \log \) key on a calculator to calculate logarithms to base 10.

**Example 9**
Find the value of \( x \) for which \( 10^x = 500 \).

\[
10^x = 500 \\
\text{So } \log_{10} 500 = x \\
x = \log_{10} 500 \\
= 2.70 \text{ (to 3 s.f.)}
\]

Since \( 10^2 = 100 \) and \( 10^3 = 1000 \), \( x \) must be somewhere between 2 and 3.
The log (or lg) button on your calculator gives values of logs to base 10.

**Exercise 1C**

1. Rewrite as a logarithm:
   a. \( 4^4 = 256 \)
   b. \( 3^{-2} = \frac{1}{9} \)
   c. \( 10^6 = 1000000 \)
   d. \( 11^3 = 11 \)

2. Rewrite using a power:
   a. \( \log_2 16 = 4 \)
   b. \( \log_5 25 = 2 \)
   c. \( \log_9 3 = \frac{1}{2} \)
   d. \( \log_3 0.2 = -1 \)
   e. \( \log_{10} 100000 = 5 \)
   f. \( \log_{10} \sqrt{10} \)

3. Find the value of:
   a. \( \log_2 8 \)
   b. \( \log_5 25 \)
   c. \( \log_{10} 1000000 \)
   d. \( \log_{12} 12 \)
   e. \( \log_7 729 \)
   f. \( \log_4 (a^{10}) \)
   g. \( \log_4 (0.25) \)

4. Find the value of \( x \) for which:
   a. \( \log_3 x = 4 \)
   b. \( \log_8 81 = 2 \)
   c. \( \log_7 x = 1 \)
   d. \( \log_8 (2x) = 2 \)
5  Find from your calculator the value to 3 s.f. of:
   a  \log_{10} 20
   b  \log_{10} 4
   c  \log_{10} 7000
   d  \log_{10} 0.786

6  Find from your calculator the value to 3 s.f. of:
   a  \log_{10} 11
   b  \log_{10} 35.3
   c  \log_{10} 0.3
   d  \log_{10} 999

1.4 You need to know the laws of logarithms

Suppose that \( \log_a x = b \) and \( \log_a y = c \)

Rewriting with powers: \( a^b = x \) and \( a^c = y \)

Multiplying: \( xy = a^b \times a^c = a^{b+c} \) (see section 1.1)

Rewriting as a logarithm: \( \log_a xy = b + c \)

- \( \log_a x \times y = \log_a x + \log_a y \) (the multiplication law)

It can also be shown that:

- \( \log_a \left( \frac{x}{y} \right) = \log_a x - \log_a y \) (the division law)\( \quad \text{Remember:} \frac{a^b}{a^c} = a^{b-c} \)

- \( \log_a (x^k) = k \log_a x \) (the power law)\( \quad \text{Remember:} (a^b)^k = a^{bk} \)

Note: You need to learn and remember the above three laws of logarithms.

Since \( (\frac{1}{x}) = x^{-1} \), the power rule shows that \( \log_a \left( \frac{1}{x} \right) = \log_a (x^{-1}) = -\log_a x \).

- \( \log_a 1 = 0 \) (since \( a^0 = 1 \))
- \( \log_a a = 1 \) (since \( a^1 = 1 \))

Example 10

Write as a single logarithm:

a  \log_3 6 + \log_3 7
b  \log_2 15 - \log_2 3
c 2 \log_5 3 + 3 \log_5 2
d \log_{10} 3 - 4 \log_{10} (\frac{1}{2})

- \( a \log_3 (6 \times 7) \quad \text{Use the multiplication law.} \)
  = \log_3 42

- \( b \log_2 (15 \div 3) \quad \text{Use the division law.} \)
  = \log_2 5

- \( c 2 \log_5 3 = \log_5 (3^2) = \log_5 9 \)
  3 \log_5 2 = \log_5 (2^3) = \log_5 8
  \log_5 9 + \log_5 8 = \log_5 72

- \( d 4 \log_{10} \left( \frac{1}{2} \right) = \log_{10} \left( \frac{1}{2} \right)^4 = \log_{10} \left( \frac{1}{16} \right) \)
  \log_{10} 3 - \log_{10} \left( \frac{1}{16} \right) = \log_{10} (3 \div \frac{1}{16})
  \quad \text{Use the power first.} \)
  = \log_{10} 48

- \text{Then use the division law.}
Example 11

Write in terms of $\log_a x$, $\log_a y$ and $\log_a z$

\[ a \quad \log_a (x^2 y z^3) \quad b \quad \log_a \left( \frac{x}{y^3} \right) \quad c \quad \log_a \left( \frac{\sqrt{y}}{z} \right) \quad d \quad \log_a \left( \frac{x}{a^4} \right) \]

\[ a \quad \log_a (x^2 y z^3) \\
= \log_a (x^2) + \log_a y + \log_a (z^3) \\
= 2 \log_a x + \log_a y + 3 \log_a z \\

b \quad \log_a \left( \frac{x}{y^3} \right) \\
= \log_a x - \log_a (y^3) \\
= \log_a x - 3 \log_a y \\

C \quad \log_a \left( \frac{\sqrt{y}}{z} \right) \\
= \log_a (\sqrt{y}) - \log_a z \\
= \log_a x + \log_a \sqrt{y} - \log_a z \\
= \log_a x + \frac{1}{2} \log_a y - \log_a z \quad \text{Use the power law } (\sqrt{y} = y^{\frac{1}{2}}). \\

D \quad \log_a \left( \frac{x}{a^4} \right) \\
= \log_a x - \log_a (a^4) \\
= \log_a x - 4 \log_a a \\
= \log_a x - 4 \quad \log_a a = 1. \\

Exercise 1D

1 Write as a single logarithm:

\[ a \quad \log_2 7 + \log_2 3 \quad b \quad \log_2 36 - \log_2 4 \\
\quad c \quad 3 \log_5 2 + \log_5 10 \quad d \quad 2 \log_6 8 - 4 \log_6 3 \\
\quad e \quad \log_{10} 5 + \log_{10} 6 - \log_{10} (\frac{1}{4}) \]

2 Write as a single logarithm, then simplify your answer:

\[ a \quad \log_2 40 - \log_2 5 \quad b \quad \log_6 4 + \log_6 9 \\
\quad c \quad 2 \log_{12} 3 + 4 \log_{12} 2 \quad d \quad \log_8 25 + \log_8 10 - 3 \log_8 5 \\
\quad e \quad 2 \log_{10} 20 - (\log_{10} 5 + \log_{10} 8) \]

3 Write in terms of $\log_a x$, $\log_a y$ and $\log_a z$:

\[ a \quad \log_a (x^3 y^4 z^2) \quad b \quad \log_a \left( \frac{x^5}{y^2} \right) \quad c \quad \log_a (a^2 x^2) \\
\quad d \quad \log_a \left( \frac{x y^2}{z} \right) \quad e \quad \log_a \sqrt{ax} \]
1.5 You can use the change of base formulae to solve equations of the form \( a^x = b \)

Working in base \( a \), suppose that:

\[
\log_a x = m
\]

Writing this as a power:

\[
a^m = x
\]

Taking logs to a different base \( b \):

\[
\log_b (a^m) = \log_b x
\]

Using the power law:

\[
m \log_b a = \log_b x
\]

Writing \( m \) as \( \log_a x \):

\[
\log_b x = \log_a x \times \log_b a
\]

This can be written as:

- \( \log_a x = \frac{\log_b x}{\log_b a} \)

This is the change of base rule for logarithms.

Using this rule, notice in particular that \( \log_a b = \frac{\log_b b}{\log_b a} \) but \( \log_b b = 1 \), so:

- \( \log_a b = \frac{1}{\log_b a} \)

---

**Example 12**

Solve the following equations, giving your answers to 3 significant figures.

<table>
<thead>
<tr>
<th>a</th>
<th>( 3^x = 20 )</th>
<th>b</th>
<th>( 8^x = 11 )</th>
<th>c</th>
<th>( 10^x = 0.7 )</th>
</tr>
</thead>
</table>

**a** \( 3^x = 20 \Rightarrow x = \log_3 20 \)

By change of base formula, changing to base 10:

\[
\log_3 20 = \frac{\log_{10} 20}{\log_{10} 3}
\]

\[
\log_3 20 = \frac{1.3010...}{0.4771...} = 2.73
\]

Give answer to 3 sf.

**b** \( 8^x = 11 \Rightarrow x = \log_8 11 \)

Changing to base 10:

\[
\log_8 11 = \frac{\log_{10} 11}{\log_{10} 8}
\]

\[
= 1.15
\]

Evaluate using calculator and give answer to 3 sf.

**c** \( 10^x = 0.7 \Rightarrow x = \log_{10} 0.7 \)

This can be found directly using the log button on a calculator.

\[
= -0.155
\]

**NB** A logarithm can give a negative answer:

\( \log_b x < 0 \) when \( 0 < x < 1 \)
Example 13

Solve the equation \( \log_4 x + 6 \log_5 5 = 5 \):

\[
\log_5 x + \frac{6}{\log_5 x} = 5 \quad \text{Use change of base rule (special case)}.
\]

Let \( \log_5 x = y \)

\[
y + \frac{6}{y} = 5
\]

Multiply by \( y \).

\[
y^2 + 6 = 5y
\]

\[
y^2 - 5y + 6 = 0
\]

\[
(y - 3)(y - 2) = 0
\]

So \( y = 3 \) or \( y = 2 \)

\[
\log_5 x = 3 \quad \text{or} \quad \log_5 x = 2
\]

\[
x = 5^3 \quad \text{or} \quad x = 5^2
\]

Write as powers.

\[
x = 125 \quad \text{or} \quad x = 25
\]

Exercise 1E

1. Find, to 3 decimal places:
   a) \( \log_7 120 \)  
   b) \( \log_4 45 \)  
   c) \( \log_2 19 \)
   d) \( \log_{11} 3 \)  
   e) \( \log_6 4 \)

2. Solve, giving your answer to 3 significant figures:
   a) \( 8^x = 14 \)  
   b) \( 9^x = 99 \)  
   c) \( 12^x = 6 \)

3. Solve, giving your answer to 3 significant figures:
   a) \( 2^x = 75 \)  
   b) \( 3^x = 10 \)  
   c) \( 5^x = 2 \)
   d) \( 4^{2x} = 100 \)

4. Solve, giving your answer to 3 significant figures:
   a) \( \log_2 x = 8 + 9 \log_2 2 \)  
   b) \( \log_4 x + 2 \log_4 4 + 3 = 0 \)  
   c) \( \log_2 x + \log_4 x = 2 \)

1.6 You need to be familiar with the functions \( y = a^x \) and \( y = \log_b x \) and to know the shapes of their graphs

As an example, look at a table of values for \( y = 2^x \):

<table>
<thead>
<tr>
<th>( x )</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>( \frac{1}{8} )</td>
<td>( \frac{1}{4} )</td>
<td>( \frac{1}{2} )</td>
<td>1</td>
<td>2</td>
<td>4</td>
<td>8</td>
</tr>
</tbody>
</table>

Hint:
A function that involves a variable power such as \( x \) is called an exponential function.

Note that
\( 2^0 = 1 \) (in fact \( a^0 = 1 \) always if \( a > 0 \))

and \( 2^{-3} = \frac{1}{2^3} = \frac{1}{8} \) (a negative index implies the ‘reciprocal’ of a positive index)
The graph of \( y = 2^x \) looks like this:

Other graphs of the type \( y = a^x \) are of a similar shape, always passing through \((0, 1)\).

Now look at the table of values of \( y = \log_2 x \):

<table>
<thead>
<tr>
<th>( x )</th>
<th>( \frac{1}{8} )</th>
<th>( \frac{1}{4} )</th>
<th>( \frac{1}{2} )</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>-3</td>
<td>-2</td>
<td>-1</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>

You should note that the values for \( x \) and \( y \) have swapped around. This means that the shape of the curve is simply a reflection in the line \( y = x \).

The graph of \( y = \log_b x \) will have a similar shape and it will always pass through \((1, 0)\) since \( \log_b 1 = 0 \) for every value of \( b \).

**Hint:** The \( y \) axis is an asymptote to the curve.

**Example 14**

a. On the same axes sketch the graphs of \( y = 3^x \), \( y = 2^x \) and \( y = 1.5^x \).

b. On another set of axes sketch the graphs of \( y = \left(\frac{1}{2}\right)^x \) and \( y = 2^x \).

a. For all the three graphs, \( y = 1 \) when \( x = 0 \). \( a^0 = 1 \)

   - When \( x > 0 \), \( 3^x > 2^x > 1.5^x \)
   - When \( x < 0 \), \( 3^x < 2^x < 1.5^x \)

   Work out the relative positions of the three graphs.
\[ b \quad \frac{1}{2} = 2^{-1} \]

So \( y = \left(\frac{1}{2}\right)^x \) is the same as \( y = (2^{-1})^x = 2^{-x} \).

\((a^m)^n = a^{mn}\)

So the graph of \( y = \left(\frac{1}{2}\right)^x \) is a reflection in the \( y \)-axis of the graph of \( y = 2^x \).

---

**Example 15**

On the same axes, sketch the graphs of \( y = \log_2 x \) and \( y = \log_5 x \).

For both graphs \( y = 0 \) when \( x = 1 \). Since \( \log_b 1 = 0 \) for every value of \( b \),

But \( \log_2 2 = 1 \) so \( y = \log_2 x \) passes through \( (2, 1) \) and \( \log_5 5 = 1 \) so \( y = \log_5 x \) passes through \( (5, 1) \).

By considering the shape of the graphs between \( y = 0 \) and \( y = 1 \), you can see that \( \log_2 x > \log_5 x \) for \( x > 1 \).

Since the log graphs are reflections of the exponential graphs then from Example 14 you can see that the reverse will apply the other side of \( (1, 0) \). So \( \log_2 x < \log_5 x \) for \( x < 1 \).

---

**Exercise 1F**

1. On the same axes sketch the graphs of
   a. \( y = 4^x \)
   b. \( y = 6^x \)
   c. \( y = \left(\frac{1}{2}\right)^x \)

2. On the same axes sketch the graphs of
   a. \( y = 3^x \)
   b. \( y = \log_3 x \)
   c. \( y = \left(\frac{1}{3}\right)^x \)

3. On the same axes sketch the graphs of
   a. \( y = \log_4 x \)
   b. \( y = \log_6 x \)

4. On the same axes sketch the graphs of
   a. \( y = 1^x \)
   b. \( y = \log_3 x \)
   c. Write down the coordinates of the point of intersection of these two graphs.
Exercise 1G

1. Simplify:
   a. \(y^3 \times y^5\)  
   b. \(3x^2 \times 2x^3\)  
   c. \((4x^2)^3 \div 2x^5\)  
   d. \(4b^2 \times 3b^3 \times b^4\)

2. Simplify:
   a. \(9x^3 \div 3x^{-3}\)  
   b. \((4\frac{2}{3})^{\frac{1}{2}}\)  
   c. \(3x^{-2} \times 2x^4\)  
   d. \(3x^{\frac{1}{3}} + 6x^{\frac{2}{3}}\)

3. Evaluate:
   a. \(\left(\frac{8}{27}\right)^{\frac{1}{3}}\)  
   d. \(\left(\frac{225}{289}\right)^{\frac{1}{3}}\)

4. Simplify:
   a. \(\frac{3}{\sqrt{63}}\)  
   b. \(\sqrt{20} + 2\sqrt{45} - \sqrt{80}\)

5. Rationalise:
   a. \(\frac{1}{\sqrt{3}}\)  
   b. \(\frac{15}{\sqrt{5}}\)

6. a. Express \(\log_a (p^2q)\) in terms of \(\log_a p\) and \(\log_a q\).
   b. Given that \(\log_a (pq) = 5\) and \(\log_a (p^2q) = 9\), find the values of \(\log_a p\) and \(\log_a q\).

7. Solve the following equations giving your answers to 3 significant figures:
   a. \(5^x = 80\)  
   b. \(7^x = 123\)

8. a. Given that \(\log_3 x = 2\), determine the value of \(x\).
    b. Calculate the value of \(y\) for which \(2 \log_3 y - \log_3 (y + 4) = 2\).
    c. Calculate the values of \(z\) for which \(\log_3 z = 4 \log_3 3\).

9. Find the values of \(x\) for which \(\log_3 x - 2 \log_3 3 = 1\).

10. Solve the equation
    \(\log_3 (2 - 3x) = \log_9 (6x^2 - 19x + 2)\).
Logarithms

1. You can simplify expressions by using rules of indices (powers).
   \[ a^m \times a^n = a^{m+n} \]
   \[ a^m \div a^n = a^{m-n} \]
   \[ a^{-n} = \frac{1}{a^n} \]
   \[ a^{\frac{1}{n}} = \sqrt[n]{a} \]
   \[ a^{\frac{m}{n}} = \sqrt[n]{a^m} \]
   \[ (a^m)^n = a^{mn} \]
   \[ a^0 = 1 \]

2. You can manipulate surds using the rules:
   \[ \sqrt{ab} = \sqrt{a} \times \sqrt{b} \]
   \[ \sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}} \]

3. The rule to rationalise surds is:
   Fractions in the form \( \frac{1}{\sqrt{a}} \), multiply the top and bottom by \( \sqrt{a} \).

4. \( \log_a n = x \) means that \( a^x = n \), where \( a \) is called the base of the logarithm.

5. \( \log_a 1 = 0 \)
   \( \log_a a = 1 \)

6. \( \log_{10} x \) is sometimes written as \( \log x \).

7. The laws of logarithms are:
   \[ \log_a xy = \log_a x + \log_a y \] (the multiplication law)
   \[ \log_a \frac{x}{y} = \log_a x - \log_a y \] (the division law)
   \[ \log_a (x)^k = k \log_a x \] (the power law)

8. From the power law,
   \[ \log_a \left( \frac{1}{x} \right) = -\log_a x \]

9. The change of base rule for logarithms can be written as
   \[ \log_a x = \frac{\log_b x}{\log_b a} \]

10. From the change of base rule, \( \log_b a = \frac{1}{\log_a b} \)
## 2.1 You can factorise quadratic expressions

- A quadratic expression has the form $ax^2 + bx + c$, where $a$, $b$, $c$ are constants and $a \neq 0$.

### Example 1

**Factorise:**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>$6x^2 + 9x$</td>
<td>b</td>
</tr>
<tr>
<td>d</td>
<td>$6x^2 - 11x - 10$</td>
<td>e</td>
</tr>
</tbody>
</table>

**a**

$6x^2 + 9x$

$= 3x(2x + 3)$

$3$ and $x$ are common factors of $6x^2$ and $9x$. So take $3x$ outside the bracket.

**b**

$x^2 - 5x - 6$

$ac = -6$

So $x^2 - 5x + 6 = x^2 + x - 6x - 6$

$= x(x + 1) - 6(x + 1)$

$= (x + 1)(x - 6)$

Here $a = 1$, $b = -5$ and $c = -6$. You need to find two brackets that multiply together to give $x^2 - 5x - 6$. So:

1. Work out $ac$.
2. Work out the two factors of $ac$ which add that give you $b$.
   
   $-6$ and $+1 = -5$
3. Rewrite the $bx$ term using these two factors.
4. Factorise first two terms and last two terms.
5. $x + 1$ is a factor of both terms, so take that outside the bracket. This is now completely factorised.

**c**

$x^2 + 6x + 8$

$= x^2 + 2x + 4x + 8$

$= x(x + 2) + 4(x + 2)$

$= (x + 2)(x + 4)$

Since $ac = 8$ and $2 + 4 = 6 = b$, factorise. $x + 2$ is a factor so you can factorise into 2 brackets.

**d**

$6x^2 - 11x - 10$

$= 6x^2 - 15x + 4x - 10$

$= 3x(2x - 5) + 2(2x - 5)$

$= (2x - 5)(3x + 2)$

$ac = -60$ and $4 - 15 = -11 = b$.

Factorise.

Factorise $(2x - 5)$.

This is called the difference of two squares as the two terms are $x^2$ and $5^2$.

The two $x$ terms, $5x$ and $-5x$, cancel each other out.

**e**

$x^2 - 25$

$= x^2 - 5^2$

$= (x + 5)(x - 5)$

This is the same as $(2x)^2 - (3y)^2$.

**f**

$4x^2 - 9y^2$

$= 2^2x^2 - 3^2y^2$

$= (2x + 3y)(2x - 3y)$
Exercise 2A

Factorise:

1. $x^2 + 4x$
2. $2x^2 + 6x$
3. $x^2 + 11x + 24$
4. $x^2 + 8x + 12$
5. $x^2 + 3x - 40$
6. $x^2 - 8x + 12$
7. $x^2 + 5x + 6$
8. $x^2 - 2x - 24$
9. $x^2 - 3x - 10$
10. $x^2 + x - 20$
11. $2x^2 + 5x + 2$
12. $3x^2 + 10x - 8$
13. $5x^2 - 16x + 3$
14. $6x^2 - 8x - 8$
15. $2x^2 + 7x - 15$
16. $2x^4 + 14x^2 + 24$
17. $x^2 - 4$
18. $x^2 - 49$
19. $4x^2 - 25$
20. $9x^2 - 25y^2$
21. $36x^2 - 4$
22. $2x^2 - 50$
23. $6x^2 - 10x + 4$
24. $15x^2 + 42x - 9$

Hints:
Question 14 - Take 2 out as a common factor first.
Question 16 - let $y = x^2$.

2.2 You can write quadratic expressions in another form by completing the square.

$x^2 + 2bx + b^2 = (x + b)^2$
$x^2 - 2bx + b^2 = (x - b)^2$

These are both perfect squares.

To complete the square of the function $x^2 + 2bx$ you need a further term $b^2$. So the completed square form is

$x^2 + 2bx = (x + b)^2 - b^2$

Similarly

$x^2 - 2bx = (x - b)^2 - b^2$

Example 2

Complete the square for the expression $x^2 + 8x$

$x^2 + 8x$

$= (x + 4)^2 - 4^2$

$= (x + 4)^2 - 16$

In general

- Completing the square: $x^2 + bx = \left(x + \frac{b}{2}\right)^2 - \left(\frac{b}{2}\right)^2$
**Example 3**

Complete the square for the expressions

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>a</strong></td>
<td><strong>b</strong></td>
</tr>
<tr>
<td>(x^2 + 12x)</td>
<td>(2x^2 - 10x)</td>
</tr>
</tbody>
</table>

\[ a \quad x^2 + 12x = (x + 6)^2 - 36 \]
\[ b \quad 2x^2 - 10x = 2(x^2 - 5x) = 2\left[(x - \frac{5}{2})^2 - \left(\frac{5}{2}\right)^2\right] \]

2\(b = 12\), so \(b = 6\)

**Exercise 2B**

Complete the square for the expressions:

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>(x^2 + 4x) &amp; 2</td>
<td>(x^2 - 6x) &amp; 3</td>

</tbody>
</table>

**2.3 You can solve quadratic equations**

Quadratic equations can have two solutions or roots. (In some cases the two roots are equal.) To solve a quadratic equation put it in the form \(ax^2 + bx + c = 0\).

**Example 4**

Solve the equation \(x^2 = 9x\):

\[ x^2 = 9x \]
\[ x^2 - 9x = 0 \]
\[ x(x - 9) = 0 \]

Then either \(x = 0\)
\[ \text{or } x - 9 = 0 \Rightarrow x = 9 \]

So \(x = 0\) or \(x = 9\) are the two solutions of the equation \(x^2 = 9x\).

A quadratic equation has two solutions (roots). In some cases the two roots are equal.

**Example 5**

Solve the equation \(x^2 - 2x - 15 = 0\):

\[ x^2 - 2x - 15 = 0 \]
\[ (x + 3)(x - 5) = 0 \]

Then either \(x + 3 = 0 \Rightarrow x = -3\)
\[ \text{or } x - 5 = 0 \Rightarrow x = 5 \]

The solutions are \(x = -3\) or \(x = 5\).
Example 6
Solve the equation $6x^2 + 13x - 5 = 0$

$$6x^2 + 13x - 5 = 0$$

$$(3x - 1)(2x + 5) = 0$$

Then either $3x - 1 = 0 \Rightarrow x = \frac{1}{3}$
or $2x + 5 = 0 \Rightarrow x = -\frac{5}{2}$
The solutions are $x = \frac{1}{3}$ or $x = -\frac{5}{2}$.

Factorise.
The solutions can be fractions or any other type of number.

Example 7
Solve the equation $x^2 - 5x + 18 = 2 + 3x$

$$x^2 - 5x + 18 = 2 + 3x$$

$$x^2 - 8x + 16 = 0$$

$$x - 4)(x - 4) = 0$$

Then either $x - 4 = 0 \Rightarrow x = 4$
or $x - 4 = 0 \Rightarrow x = 4$

$\Rightarrow x = 4$

Rearrange in the form $ax^2 + bx + c = 0$.
Factorise.
Here $x = 4$ is the only solution, i.e. the two roots are equal.

Example 8
Solve the equation $(2x - 3)^2 = 25$

$$(2x - 3)^2 = 25$$

$$2x - 3 = \pm 5$$

$$2x = 3 \pm 5$$

Then either $2x = 3 + 5 \Rightarrow x = 4$
or $2x = 3 - 5 \Rightarrow x = -1$
The solutions are $x = 4$ or $x = -1$.

This is a special case.
Take the square root of both sides.
Remember $\sqrt{25} = +5$ or $-5$.
Add 3 to both sides.

Example 9
Solve the equation $(x - 3)^2 = 7$

$$(x - 3)^2 = 7$$

$$x - 3 = \pm \sqrt{7}$$

$$x = 3 \pm \sqrt{7}$$

Then either $x = 3 + \sqrt{7}$
or $x = 3 - \sqrt{7}$
The solutions are $x = 3 + \sqrt{7}$ or $x = 3 - \sqrt{7}$.

Square root. (If you do not have a calculator, leave this in surd form.)

Example 10
Solve the equation $x^2 + 8x + 10 = 0$ by completing the square.

$$x^2 + 8x + 10 = 0$$

$$x^2 + 8x = -10$$

$$(x + 4)^2 - 4^2 = -10$$

$$(x + 4)^2 = -10 + 16$$

$$(x + 4)^2 = 6$$

$$x + 4 = \pm \sqrt{6}$$

$$x = -4 \pm \sqrt{6}$$

Then the solutions (roots) of $x^2 + 8x + 10 = 0$ are either $x = -4 + \sqrt{6}$ or $x = -4 - \sqrt{6}$.

Check coefficient of $x^2 = 1$.
Subtract 10 to get LHS in the form $ax^2 + b$.
Complete the square for $(x^2 + 8x)$.
Add $4^2$ to both sides.
Square root both sides.
Subtract 4 from both sides.
Leave your answer in surd form as this is a non-calculator question.
Example 11

Solve the equation $2x^2 - 8x + 7 = 0$.

$2x^2 - 8x + 7 = 0$

$x^2 - 4x + \frac{7}{2} = 0$

$x^2 - 4x = -\frac{7}{2}$

$(x - 2)^2 - (2)^2 = -\frac{7}{2}$

$(x - 2)^2 = -\frac{7}{2} + 4$

$(x - 2)^2 = \frac{1}{2}$

$x - 2 = \pm \frac{1}{\sqrt{2}}$

$x = 2 \pm \frac{1}{\sqrt{2}}$

So the roots are either

$x = 2 + \frac{1}{\sqrt{2}}$

or $x = 2 - \frac{1}{\sqrt{2}}$

The coefficient of $x^2 = 2$.
So divide by 2.
Subtract $\frac{7}{2}$ from both sides.
Complete the square for $x^2 - 4x$.
Add $(2)^2$ to both sides.
Combine the RHS.
Square root both sides.
Add 2 to both sides.

Exercise 2C

Solve the following equations:

1 $x^2 = 4x$
2 $x^2 = 25x$
3 $3x^2 = 6x$
4 $5x^2 = 30x$
5 $x^2 + 3x + 2 = 0$
6 $x^2 + 5x + 4 = 0$
7 $x^2 + 7x + 10 = 0$
8 $x^2 - x - 6 = 0$
9 $x^2 - 8x + 15 = 0$
10 $x^2 - 9x + 20 = 0$
11 $x^2 - 5x - 6 = 0$
12 $x^2 - 4x - 12 = 0$
13 $2x^2 + 7x + 3 = 0$
14 $6x^2 - 7x - 3 = 0$
15 $6x^2 - 5x - 6 = 0$
16 $4x^2 - 16x + 15 = 0$
17 $(x - 7)^2 = 36$
18 $(2x - 3)^2 = 9$
19 $3x^2 = 5$
20 $2x^2 - 8$
21 $(x - 3)^2 = 13$
22 $(3x - 1)^2 = 11$
23 $6x^2 - 7 = 11x$
24 $5x^2 - 10x^2 = -7 + x + x^2$
25 $4x^2 + 17x = 6x - 2x^2$
26 $4x^2 + 17x = 6x - 2x^2$

Solve these quadratic equations by completing the square (remember to leave your answer in surd form):

27 $x^2 + 6x + 1 = 0$
28 $x^2 + 12x + 3 = 0$
29 $x^2 - 10x = 5$
30 $x^2 + 4x - 2 = 0$
31 $x^2 - 3x - 5 = 0$
32 $2x^2 - 7 = 4x$
33 $4x^2 - x = 8$
34 $10 = 3x - x^2$
35 $15 - 6x - 2x^2 = 0$
36 $5x^2 + 8x - 2 = 0$
2.4 You can solve quadratic equations \( ax^2 + bx + c = 0 \) by using the formula
\[
x = \frac{-b \pm \sqrt{(b^2 - 4ac)}}{2a}
\]

**Example 12**

Show that the solutions of \( ax^2 + bx + c = 0 \) are
\[
x = \frac{-b \pm \sqrt{(b^2 - 4ac)}}{2a}
\]

\[
x^2 + \frac{b}{a}x + \frac{c}{a} = 0
\]

\[
x^2 + \frac{b}{a}x = -\frac{c}{a}
\]

\[
\left( x + \frac{b}{2a} \right)^2 - \frac{b^2}{4a^2} = -\frac{c}{a}
\]

\[
\left( x + \frac{b}{2a} \right)^2 = \frac{b^2}{4a^2} - \frac{c}{a}
\]

\[
\left( x + \frac{b}{2a} \right)^2 = \frac{b^2 - 4ac}{4a^2}
\]

\[
x + \frac{b}{2a} = \pm \frac{\sqrt{b^2 - 4ac}}{2a}
\]

Thus
\[
x = \frac{-b \pm \sqrt{(b^2 - 4ac)}}{2a}
\]

To do this complete the square.

The coefficient \( x^2 \) is \( a \) so divide by \( a \).

Subtract \( \frac{c}{a} \) from both sides.

Complete the square.

Add \( \frac{b^2}{4a^2} \) to both sides.

Combine the RHS.

Square root.

Subtract \(-2bx\) from both sides.

**Example 13**

Solve \( 4x^2 - 3x - 2 = 0 \) by using the formula.

\[
x = \frac{-(-3) \pm \sqrt{[(-3)^2 - 4(4)(-2)]}}{2 \times 4}
\]

Use \( x = \frac{-b \pm \sqrt{(b^2 - 4ac)}}{2a} \) where \( a = 4, b = -3, c = -2 \).

\[
x = \frac{+3 \pm \sqrt{(9 + 32)}}{8}
\]

\[
x = \frac{+3 \pm \sqrt{41}}{8}
\]

Then \( x = \frac{+3 + \sqrt{41}}{8} \) or \( 1.18 \)

or \( x = \frac{+3 - \sqrt{41}}{8} \) or \(-0.425\) Leave your answer in surd form.

The part of the formula \( b^2 - 4ac \) is called the discriminant.

The discriminant can be used to identify whether the roots of a particular equation are equal and real, unequal and real or not real.

The discriminant of the equation \( ax^2 + bx + c = 0 \) is \( b^2 - 4ac \)

- If \( b^2 - 4ac > 0 \) the roots of the equation are real and unequal
- If \( b^2 - 4ac = 0 \) the roots of the equations are real and equal
- If \( b^2 - 4ac < 0 \) there are no real roots of the equation
Example 14
Calculate the discriminant of each of the following equations and, where possible, find the root(s) to 3 significant figures.

(a) \(2x^2 - 3x + 5 = 0\) \hspace{1cm} (b) \(3x^2 - x - 1 = 0\) \hspace{1cm} (c) \(4x^2 - 12x + 9 = 0\)

(a) \(2x^2 - 3x + 5 = 0\)

\[ a = 2, \ b = -3, \ c = 5 \]

\[ b^2 - 4ac = (-3)^2 - 4 \times 2 \times 5 = 9 - 40 = -31 \]

So there are no real roots

(b) \(3x^2 - x - 1 = 0\)

\[ a = 3, \ b = -1, \ c = -1 \]

\[ b^2 - 4ac = (-1)^2 - 4 \times 3 \times (-1) = 1 + 12 = 13 \]

So there are two unequal real roots

Roots are:
\[ x = \frac{-(-1) \pm \sqrt{13}}{2 \times 3} \]
\[ x = 0.768, \ -0.434 \]

Identify the values for \(a, b\) and \(c\) and calculate the discriminant

(c) \(4x^2 - 12x + 9 = 0\)

Discriminant = \((-12)^2 - 4 \times 4 \times 9 = 144 - 144 = 0\)

So the roots are real and equal

\[ x = \frac{-(-12)}{2 \times 4} \]
\[ x = \frac{3}{2} \]

Calculate the discriminant

Identify values for \(a, b\) and \(c\). Evaluate \(b^2 - 4ac\) remembering that \((-3)^2 = +9\)

So there are no real roots

Exercise 2D
In questions 1–8 use the discriminant to determine whether the following equations have no real roots, equal roots or unequal roots.

Where possible find the root(s) to 3 significant figures.

1 \(x^2 - 2x + 1 = 0\) \hspace{1cm} 2 \(x^2 - 2x - 1 = 0\)

3 \(x^2 - 3x - 2 = 0\) \hspace{1cm} 4 \(x^2 - 3x + 4 = 0\)

5 \(2x^2 + x - 2 = 0\) \hspace{1cm} 6 \(3x^2 - x + 3 = 0\)

7 \(3x^2 = 7 - x\) \hspace{1cm} 8 \(2x^2 = x + 4\)

Using the formula

When the discriminant = 0 you can always factorise so in this case:
\(4x^2 - 12x + 9 = (2x - 3)^2 = 0\)
giving \(x = \frac{3}{2}\)
In questions 9-18 solve the equations by using the formula and give your answers correct to 3 significant figures.

9 \( x^2 + 3x + 1 = 0 \)
10 \( x^2 - 3x - 2 = 0 \)
11 \( x^2 + 6x + 6 = 0 \)
12 \( x^2 - 5x - 2 = 0 \)
13 \( 3x^2 + 10x - 2 = 0 \)
14 \( 4x^2 - 4x - 1 = 0 \)
15 \( 7x^2 + 9x + 1 = 0 \)
16 \( 5x^2 + 4x - 3 = 0 \)
17 \( 4x^2 - 7x = 2 \)
18 \( 11x^2 + 2x - 7 = 0 \)

2.5 You can use functions of the roots of a quadratic equation

The quadratic equation \( ax^2 + bx + c = 0 \) can be written as
\[
\frac{b}{a}x + \frac{c}{a} = 0 \quad \text{or} \quad x^2 + px + q = 0
\]
If the roots of \( x^2 + px + q = 0 \) are \( \alpha \) and \( \beta \) then
\[
x^2 + px + q = (x - \alpha)(x - \beta)
\]
so \( x^2 + px + q = x^2 - \alpha x - \beta x + \alpha \beta \)
i.e. \( x^2 + px + q = x^2 - (\alpha + \beta)x + \alpha \beta \)
Comparing coefficients \( p = - (\alpha + \beta) \)
and \( q = \alpha \beta \)

So for a quadratic equation with coefficient of \( x^2 = 1 \) and with roots \( \alpha \) and \( \beta \)

Sum of roots = \( \alpha + \beta = - \) the coefficient of \( x \)
and Product of roots = \( \alpha \beta = \) the constant term

So for the equation \( ax^2 + bx + c = 0 \)
- **sum of roots** = \( \alpha + \beta = - \frac{b}{a} \)
- **product of roots** = \( \alpha \beta = \frac{c}{a} \)

These results can also be used to find the equation of a quadratic equation given its roots.

**Example 15**

The roots of the equation \( 3x^2 + x - 6 = 0 \) are \( \alpha \) and \( \beta \).

a Find an expression for \( \alpha + \beta \) and an expression for \( \alpha \beta \).

b Hence find an expression for \( \alpha^2 + \beta^2 \) and an expression for \( \alpha^2 \beta^2 \).

c Find a quadratic equation with roots \( \alpha^2 \) and \( \beta^2 \).

\begin{align*}
a & \quad 3x^2 + x - 6 = 0 \\
\Rightarrow & \quad x^2 + \frac{1}{3}x - 2 = 0 \\
\text{Sum of roots, } \alpha + \beta & = -\frac{1}{3} \\
\text{Product of roots, } \alpha \beta & = -2
\end{align*}

Divide by 3 to obtain a quadratic equation with coefficient of \( x^2 = 1 \)

The sum of the roots = \( - \) the coefficient of \( x \)
and the product of the roots = the constant term
\[
\begin{align*}
\text{b} & \quad (\alpha + \beta)^2 = \alpha^2 + 2\alpha\beta + \beta^2 \\
& \quad \text{so} \quad \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta \\
& \quad \text{i.e.} \quad \alpha^2 + \beta^2 = \left(\frac{-1}{3}\right)^2 - 2(-2) \\
& \quad = \frac{4}{9} \quad \text{or} \quad \frac{37}{9} \\
& \quad \alpha^2\beta^2 = (\alpha\beta)^2 = (-2)^2 = 4 \\
\text{c} & \quad \text{Let the equation be } x^2 + px + q = 0 \\
& \quad \Rightarrow \quad p = -(\alpha^2 + \beta^2) = -\frac{37}{9} \\
& \quad q = \alpha^2\beta^2 = 4 \\
& \quad \text{So equation is: } x^2 - \frac{37}{9}x + 4 = 0 \\
& \quad \text{or} \quad 9x^2 - 37x + 36 = 0 \\
\text{Notice that this question can be answered without finding the values of } \alpha \text{ and } \beta. \\
\text{Indeed sometimes } \alpha \text{ and } \beta \text{ may not even be real numbers.}
\end{align*}
\]

**Example 16**

The roots of the equation \(x^2 - 3x - 2 = 0\) are \(\alpha\) and \(\beta\).

Without finding the value of \(\alpha\) or the value of \(\beta\), find equations with roots

\text{a} \quad 3\alpha, 3\beta \\
\text{b} \quad \frac{1}{\alpha}, \frac{1}{\beta} \\
\text{c} \quad \alpha^2, \beta^2

If \(\alpha\) and \(\beta\) are the roots of \(x^2 - 3x - 2 = 0\)

\(\Rightarrow \quad \alpha + \beta = 3\) \\
\(\alpha\beta = -2\) \\

\(\Rightarrow \quad \text{Sum of roots} \quad = 3(\alpha + \beta) = 3 \times 3 = 9\) \\
\(\text{Product of roots} \quad = 3\alpha \times 3\beta = 9\alpha\beta = -18\) \\
Equation is: \(x^2 - 9x - 18 = 0\) \\

Coefficient of \(x\) is \(-\text{(sum of roots)}\) and product of the roots is the constant term.

\(\Rightarrow \quad \text{If roots are} \quad \frac{1}{\alpha}, \frac{1}{\beta} \quad \text{then} \)

\(\Rightarrow \quad \text{Sum of roots} \quad = \frac{1}{\alpha} + \frac{1}{\beta} = \frac{\beta + \alpha}{\alpha\beta} \quad \Rightarrow \quad \alpha + \beta = 3\) \\
\(\quad \quad \frac{3}{-2} \quad \text{or} \quad -1.5\) \\
\(\text{Product of roots} \quad = \frac{1}{\alpha} \times \frac{1}{\beta} = \frac{1}{\alpha\beta} \quad \Rightarrow \quad \alpha\beta = -2\) \\
\(\quad \frac{1}{-2} \quad \text{or} \quad -0.5\) \\
Equation is: \(x^2 + \frac{3}{2}x - \frac{1}{2} = 0\) \\
\(\text{or} \quad 2x^2 + 3x - 1 = 0\) \\

Coefficient of \(x\) is \(-\text{(sum of roots)}\) and product of the roots is the constant term.

\(\Rightarrow \quad \text{If the roots are} \quad \alpha^2, \beta^2 \quad \text{then} \)

\(\Rightarrow \quad \text{Sum of roots} \quad = \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta \quad \Rightarrow \quad \text{Notice the manipulation as used} \)
\(\quad = 3^2 - 2(-2) = 13\) \\
\(\text{Product of roots} \quad = \alpha^2\beta^2 = (\alpha\beta)^2 = (-2)^2 = 4\) \\
Equation is: \(x^2 - 13x + 4 = 0\)
Exercise 2E

1. The roots of the equation \( x^2 + 5x + 2 = 0 \) are \( \alpha \) and \( \beta \). Find an equation whose roots are a) \( 2\alpha + 1 \) and \( 2\beta + 1 \) b) \( \alpha \beta \) and \( \alpha^2 \beta^2 \)

2. The roots of the equation \( x^2 + 6x + 1 = 0 \) are \( \alpha \) and \( \beta \). Find an equation whose roots are a) \( \alpha + 3 \) and \( \beta + 3 \) b) \( \frac{\alpha}{\beta} \) and \( \frac{\beta}{\alpha} \)

3. The roots of the equation \( x^2 - x + 3 = 0 \) are \( \alpha \) and \( \beta \). Find an equation whose roots are a) \( \alpha + 2 \) and \( \beta + 2 \) b) \( \alpha^2 \) and \( \beta^2 \)

4. The roots of the equation \( x^2 + x - 1 = 0 \) are \( \alpha \) and \( \beta \). Find an equation whose roots are a) \( \frac{1}{\alpha} \) and \( \frac{1}{\beta} \) b) \( \frac{\alpha}{\alpha + \beta} \) and \( \frac{\beta}{\alpha + \beta} \)

Mixed Exercise 2F

1. Factorise these expressions completely:
   a) \( 3x^2 + 4x \)
   b) \( 4y^2 + 10y \)
   c) \( x^2 + xy + xy^2 \)
   d) \( 8xy^3 + 10x^2y \)

2. Factorise:
   a) \( x^2 + 3x + 2 \)
   b) \( 3x^2 + 6x \)
   c) \( x^2 - 2x - 35 \)
   d) \( 2x^2 - x - 3 \)
   e) \( 5x^3 - 13x - 6 \)
   f) \( 6 - 5x - x^2 \)

3. Solve the following equations:
   a) \( y^2 + 3y + 2 = 0 \)
   b) \( 3x^2 + 13x - 10 = 0 \)
   c) \( 5x^2 - 10x = 4x + 3 \)
   d) \( (2x - 5)^2 = 7 \)

4. Solve the following equations by:
   i) completing the square ii) using the formula.
   a) \( x^2 + 5x + 2 = 0 \)
   b) \( x^2 - 4x - 3 = 0 \)
   c) \( 5x^2 + 3x - 1 = 0 \)
   d) \( 3x^2 - 5x = 4 \)

5. Given that for all values of \( x \):
   \( 3x^2 + 12x + 5 = p(x + q)^2 + r \)
   a) find the values of \( p, q \) and \( r \) b) solve the equation \( 3x^2 + 12x + 5 = 0 \)

6. Find the values of \( k \) for which \( x^2 + kx + 4 = 0 \) has equal roots.

7. Find the values of \( k \) for which \( kx^2 + 8x + k = 0 \) has equal roots.

8. Given that \( \alpha \) and \( \beta \) (\( \alpha > \beta \)) are the roots of the equation \( 2x^2 - 7x + 3 = 0 \), find the exact value of a) \( \alpha^2 + \beta^2 \) b) \( \alpha - \beta \) c) \( \alpha^3 - \beta^3 \)

   **Hint:** \( \alpha^3 - \beta^3 = (\alpha - \beta)(\alpha^2 + \alpha\beta + \beta^2) \)

9. The equation \( x^2 - 2tx + t = 0 \), where \( t \) is a positive constant, has roots \( \alpha \) and \( \beta \).
   a) Find, in terms of \( t \), \( \alpha \beta \) and \( \alpha^2 + \beta^2 \)
   b) Given that \( \alpha - \beta = 24 \), find the value of \( t \).
   c) an equation with roots \( \frac{\alpha}{\beta} \) and \( \frac{\beta}{\alpha} \).
Chapter 2: Summary

1 \( x^2 - y^2 = (x - y)(x + y) \)
   This is called the difference of two squares.

2 The general form of a quadratic equation is
   \( 0 = ax^2 + bx + c \) where \( a, b, c \) are constants and \( a \neq 0 \).

3 Quadratic equations can be solved by:
   - factorisation
   - completing the square:
     \[ x^2 + bx = \left(x + \frac{b}{2}\right)^2 - \left(\frac{b}{2}\right)^2 \]
   - using the formula
     \[ x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \]

4 A quadratic equation has two solutions, which may be equal, or there may be no real solutions.

5 The discriminant of the quadratic expression
   \( ax^2 + bx + c \) is \( b^2 - 4ac \)

6 If \( \alpha \) and \( \beta \) are the roots of the equation \( ax^2 + bx + c = 0 \)
   - \( \alpha + \beta = -\frac{b}{a} \)
   - \( \alpha\beta = \frac{c}{a} \)
3.1 You can divide a polynomial by \((ax \pm b)\)

**Example 1**
Divide \(x^3 + 2x^2 - 17x + 6\) by \((x - 3)\).

1. Start by dividing the first term of the polynomial by \(x\), so that \(x^3 / x = x^2\).
   
   \[
   \frac{x^3}{x} = x^2
   \]

2. Next multiply \((x - 3)\) by \(x^2\), so that \(x^2 \times (x - 3) = x^3 - 3x^2\).
   
   \[
   x^2 \times (x - 3) = x^3 - 3x^2
   \]

3. Now subtract, so that \((x^3 + 2x^2) - (x^3 - 3x^2) = 5x^2\).
   
   \[
   (x^3 + 2x^2) - (x^3 - 3x^2) = 5x^2
   \]

4. Finally copy \(-17x\).

**Example 2**
Divide \(4x^3 + x^2 - 11x + 6\) by \(4x - 3\).

1. Divide \(4x\) into \(4x^3\) to get \(x^2\)

\[
\frac{4x^3}{4x} = x^2
\]

2. Then multiply \(x^2\) \((4x - 3)\)

\[
4x^3 \times (4x - 3) = 16x^4 - 12x^3
\]

3. Subtract, remembering that \(x^2 - 3x^2 = +4x^2\)

\[
16x^4 - 12x^3 - 4x^2 - 11x + 6
\]
2 \[ \frac{x^2 + x}{4x^3 + 3x^2 + x^2 - 11x + 6} \]

- Repeat method.
- Divide \(4x^2\) by \(4x\) to get \(x\).
- \(\frac{4x^2 - 11x + 6}{4x^2 - 3x}\)
- \(\frac{4x^2 - 3x}{-8x + 6}\)
- \(\frac{-8x + 6}{0}\)
- Multiply \(x(4x - 3)\) and subtract

3 \[ \frac{x^2 + x - 2}{4x^3 - 3x^2 + x^2 - 11x + 6} \]

- Finally divide \(-8x\) by \(4x\) to get \(-2\).
- \(\frac{4x^2 - 11x + 6}{4x^2 - 3x}\)
- \(\frac{4x^2 - 3x}{-8x + 6}\)
- \(\frac{-8x + 6}{0}\)
- Multiply \(-2(4x - 3)\) and subtract to get \(0\)

so \(4x^3 + x^2 - 11x + 6 = (4x - 3)(x^2 + x - 2)\)

Exercise 3A

1 Divide:
  a \(x^3 + 6x^2 + 8x + 3\) by \((x + 1)\)
  b \(x^3 + 7x^2 - 3x - 54\) by \((x + 6)\)
  c \(x^3 - x^2 + x + 14\) by \((x + 2)\)
  d \(x^3 - 5x^2 + 8x - 4\) by \((x - 2)\)
  e \(x^3 - 8x^2 + 13x + 10\) by \((x - 5)\)

2 Divide:
  a \(6x^3 + 27x^2 + 14x + 8\) by \((x + 4)\)
  b \(3x^3 - 10x^2 - 10x + 8\) by \((x - 4)\)
  c \(2x^3 + 4x^2 - 9x - 9\) by \((x + 3)\)
  d \(-3x^3 + 2x^2 - 2x - 7\) by \((x + 1)\)
  e \(-5x^3 - 27x^2 + 23x + 30\) by \((x + 6)\)

3 Divide
  a \(2x^3 + 5x^2 - 5x + 1\) by \((2x - 1)\)
  b \(3x^3 + 2x^2 - 3x - 2\) by \((3x + 2)\)
  c \(6x^3 + x^2 - 7x + 2\) by \((3x - 1)\)
  d \(4x^3 + 4x^2 + 5x + 12\) by \((2x + 3)\)
  e \(2x^3 + 7x^2 + 7x + 2\) by \((2x + 1)\)

3.2 You can factorise a polynomial by using the factor theorem:
if \(f(x)\) is a polynomial and \(f(p) = 0\), then \(x - p\) is a factor of \(f(x)\).

Example 3

Show that \((x - 2)\) is a factor of \(x^3 + x^2 - 4x - 4\) by the factor theorem

\[ f(x) = x^3 + x^2 - 4x - 4 \]

Write the polynomial as a function.

\[ f(2) = (2)^3 + (2)^2 - 4(2) - 4 \]

Substitute \(x = 2\) into the polynomial.

\[ = 8 + 4 - 8 - 4 \]

Use the factor theorem:

\[ = 0 \]

If \(f(p) = 0\), then \(x - p\) is a factor of \(f(x)\).

Here \(p = 2\), so \((x - 2)\) is a factor of \(x^3 + x^2 - 4x - 4\).

So \((x - 2)\) is a factor of \(x^3 + x^2 - 4x - 4\).
Example 4

Factorise \(2x^3 + x^2 - 18x - 9\).

\[
f(x) = 2x^3 + x^2 - 18x - 9
\]

Write the polynomial as a function.

\[
f(-1) = 2(-1)^3 + (-1)^2 - 18(-1) - 9 = 8
\]

Try values of \(x\), e.g. \(-1, 1, 2, 3\) \ldots until you find \(f(p) = 0\).

\[
f(1) = 2(1)^3 + (1)^2 - 18(1) - 9 = -24
\]

\[
f(2) = 2(2)^3 + (2)^2 - 18(2) - 9 = -25
\]

\[
f(3) = 2(3)^3 + (3)^2 - 18(3) - 9 = 0
\]

Use the factor theorem:

If \(f(p) = 0\), then \(x - p\) is a factor of \(f(x)\).

Here \(p = 3\).

So \((x - 3)\) is a factor of \(2x^3 + x^2 - 18x - 9\).

\[
\begin{align*}
2x^2 + 7x + 3 \\
2x^3 - 6x^2 \\
\underline{7x^2 - 18x} \\
7x^2 - 21x \\
\underline{3x - 9} \\
3x - 9 \\
\underline{0}
\end{align*}
\]

You can check your division here:

\((x - 3)\) is a factor of \(2x^3 + x^2 - 18x - 9\),

so the remainder must = 0.

\[
2x^3 + x^2 - 18x - 9 = (x - 3)(2x^2 + 7x + 3)
\]

\[
2x^3 + x^2 - 18x - 9 = (x - 3)(2x + 1)(x + 3)
\]

\[
2x^2 + 7x + 3\] can also be factorised.

Example 5

Given that \((x + 1)\) is a factor of \(4x^4 - 3x^2 + a\), find the value of \(a\).

\[
f(x) = 4x^4 - 3x^2 + a
\]

Write the polynomial as a function.

\[
f(-1) = 0
\]

Use the factor theorem the other way around:

\[
4(-1)^4 - 3(-1)^2 + a = 0
\]

\[
x - p\) is a factor of \(f(x)\), so \(f(p) = 0
\]

\[
4 - 3 + a = 0
\]

Here \(p = -1\).

\[
a = -1
\]

Substitute \(x = -1\) and solve the equation for \(a\).

Remember \((-1)^4 = 1\).

Exercise 3B

1. Use the factor theorem to show that:
   - \((x - 1)\) is a factor of \(4x^2 - 3x^2 - 1\)
   - \((x + 3)\) is a factor of \(5x^4 - 45x^2 - 18\)
   - \((x - 4)\) is a factor of \(-3x^3 + 13x^2 - 6x + 8\)

2. Show that \((x - 1)\) is a factor of \(x^3 + 6x^2 + 5x - 12\) and hence factorise the expression completely.

3. Show that \((x + 1)\) is a factor of \(x^3 + 3x^2 - 33x - 35\) and hence factorise the expression completely.

4. Show that \((x - 5)\) is a factor of \(x^3 - 7x^2 + 2x + 40\) and hence factorise the expression completely.
5. Show that \((x - 2)\) is a factor of \(2x^3 + 3x^2 - 18x + 8\) and hence factorise the expression completely.

6. Each of these expressions has a factor \((x \pm p)\). Find a value of \(p\) and hence factorise the expression completely.
   \[\begin{align*}
   &a \quad x^3 - 10x^2 + 19x + 30 \\
   &b \quad x^3 + x^2 - 4x - 4 \\
   &c \quad x^3 - 4x^2 - 11x + 30
   \end{align*}\]

7. Factorise:
   \[\begin{align*}
   &a \quad 2x^3 + 5x^2 - 4x - 3 \\
   &b \quad 2x^3 - 17x^2 + 38x - 15 \\
   &c \quad 3x^3 + 8x^2 + 3x - 2 \\
   &d \quad 6x^3 + 11x^2 - 3x - 2 \\
   &e \quad 4x^3 - 12x^2 - 7x + 30
   \end{align*}\]

8. Given that \((x - 1)\) is a factor of \(5x^3 - 9x^2 + 2x + a\) find the value of \(a\).

9. Given that \((x + 3)\) is a factor of \(6x^3 - bx^2 + 18\) find the value of \(b\).

10. Given that \((x - 1)\) and \((x + 1)\) are factors of \(px^3 + qx^2 - 3x - 7\) find the values of \(p\) and \(q\).

**3.3** You can find the remainder when a polynomial is divided by \((ax - b)\) by using the remainder theorem:
If a polynomial \(f(x)\) is divided by \((ax - b)\) then the remainder is \(f\left(\frac{b}{a}\right)\).

---

**Example 6**

Find the remainder when \(x^3 - 20x + 3\) is divided by \((x - 4)\) using:

\[\begin{align*}
   &a \quad \text{algebraic division} \\
   &b \quad \text{the remainder theorem}
\end{align*}\]

\[\begin{align*}
   &x^3 - 20x + 3 \\
   &\quad \overline{x - 4} \big| x^3 - 4x^2 + 0x^2 - 20x + 3 \\
   &\quad \quad -4x^2 - 20x \\
   &\quad \quad \underline{4x^2} \\
   &\quad \quad \quad -4x + 3 \\
   &\quad \quad \underline{4x} \\
   &\quad \quad \quad \quad -13
\end{align*}\]

The remainder is \(-13\).

\[\begin{align*}
   &b \quad f(x) = x^3 - 20x + 3 \\
   &\quad \text{Write the polynomial as a function.} \\
   &\quad \text{Use the remainder theorem: If } f(x) \text{ is divided} \\
   &\quad \text{by } (ax - b), \text{ then the remainder is } f\left(\frac{b}{a}\right). \\
   &f(4) = (4)^3 - 20(4) + 3 \\
   &\quad = 64 - 80 + 3 \\
   &\quad = -13
\end{align*}\]

The remainder is \(-13\).

So we could write
\[\begin{align*}
   &\frac{x^3 - 20x + 3}{x - 4} = x^2 + 4x - 4 + \frac{-13}{x - 4} \\
   \text{or } &x^3 - 20x + 3 = (x - 4)(x^2 + 4x - 4) - 13 \quad \text{This } -13 \text{ is called the remainder} \\
   &\text{This } x^2 + 4x - 4 \text{ is called the quotient}
Example 7

When \(8x^4 - 4x^3 + ax^2 - 1\) is divided by \((2x + 1)\) the remainder is 3. Find the value of \(a\).

\[
\begin{align*}
8\left(-\frac{1}{2}\right)^4 - 4\left(-\frac{1}{2}\right)^3 + a\left(-\frac{1}{2}\right)^2 - 1 &= 3 \\
8\left(\frac{1}{16}\right) - 4\left(-\frac{1}{8}\right) + a\left(\frac{1}{4}\right) - 1 &= 3 \\
\frac{1}{2} + \frac{1}{2} + \frac{1}{4}a - 1 &= 3 \\
\frac{1}{4}a &= 3 \\
a &= 12
\end{align*}
\]

Use the remainder theorem: If \(f(x)\) is divided by \((ax - b)\), then the remainder is \(f\left(\frac{b}{a}\right)\).

Compare \((2x + 1)\) to \((ax - b)\), so \(a = 2\), \(b = -1\) and the remainder is \(f\left(-\frac{1}{2}\right)\).

Using the fact that the remainder is 3, substitute \(x = -\frac{1}{2}\) and solve the equation for \(a\).

\[
\left(-\frac{1}{2}\right)^3 = -\frac{1}{2} \times -\frac{1}{2} = -\frac{1}{8}
\]

Exercise 3C

1. Find the remainder when:
   a. \(4x^3 - 5x^2 + 7x + 1\) is divided by \((x - 2)\)
   b. \(2x^3 - 32x^3 + x - 10\) is divided by \((x - 4)\)
   c. \(-2x^3 + 6x^2 + 5x - 3\) is divided by \((x + 1)\)
   d. \(7x^3 + 6x^2 - 45x + 1\) is divided by \((x + 3)\)

2. When \(2x^3 - 3x^2 - 2x + a\) is divided by \((x - 1)\) the remainder is 24. Find the value of \(a\).

3. When \(-3x^3 + 4x^2 + bx + 6\) is divided by \((x + 2)\) the remainder is 10. Find the value of \(b\).

4. When \(16x^3 - 32x^2 + cx - 8\) is divided by \((2x - 1)\) the remainder is 1. Find the value of \(c\).

5. Show that \((2x - 1)\) is a factor of \(2x^3 + 17x^2 + 31x - 20\).

6. \(f(x) = x^3 + 3x + q\). Given \(f(2) = 3\), find \(f(-2)\).

   **Hint for question 6:**
   First find \(q\).

7. \(g(x) = x^3 + ax^2 + 3x + 6\). Given \(g(-1) = 2\), find the remainder when \(g(x)\) is divided by \((3x - 2)\).

8. The expression \(2x^3 - x^2 + ax + b\) gives a remainder 14 when divided by \((x - 2)\) and a remainder \(-86\) when divided by \((x + 3)\). Find the values of \(a\) and \(b\).

9. The expression \(3x^3 + 2x^2 - px + q\) is divisible by \((x - 1)\) but leaves a remainder of 10 when divided by \((x + 1)\). Find the values of \(p\) and \(q\).

   **Hint for question 9:**
   Solve simultaneous equations.
3.4 You can use the substitution method to solve simultaneous equations where one equation is linear and the other is quadratic.

Example 8
Solve the equations:

a  \[
x + 2y = 3 \\
x^2 + 3xy = 10
\]

b  \[
3x - 2y = 1 \\
x^2 + y^2 = 25
\]

a  \[
x = 3 - 2y
\]

(3 - 2y)^2 + 3y(3 - 2y) = 10

9 - 12y + 4y^2 + 9y - 6y^2 = 10

-2y^2 - 3y - 1 = 0

-2y^2 + 3y + 1 = 0

(2y + 1)(y + 1) = 0

\[
y = \frac{1}{2} \text{ or } y = -1
\]

So \(x = 4\) or \(x = -1\)

Find the corresponding \(x\)-values by substituting the \(y\)-values into \(x = 3 - 2y\).

There are two solution pairs. The graph of the linear equation (straight line) would intersect the graph of the quadratic (curve) at two points.

Solutions are \(x = 4, y = -\frac{1}{2}\) and \(x = 5, y = -1\)

b  \[
3x - 2y = 1
\]

Find \(y = \ldots\) from linear equation.

\[
2y = 3x - 1
\]

\[
y = \frac{3x - 1}{2}
\]

Substitute \(y = \frac{3x - 1}{2}\) into the quadratic equation to form an equation in \(x\).

\[
x^2 + \left(\frac{3x - 1}{2}\right)^2 = 25
\]

\[
x^2 + \frac{9x^2 - 6x + 1}{4} = 25
\]

\[
4x^2 + 9x^2 - 6x + 1 = 100
\]

\[
13x^2 - 6x - 99 = 0
\]

\[
(13x + 33)(x - 3) = 0
\]

\[
x = -\frac{33}{13} \text{ or } x = 3
\]

\[
y = -\frac{56}{13} \text{ or } y = 4
\]

Substitute \(x\)-values into \(y = \frac{3x - 1}{2}\).

Solutions are \(x = 3, y = 4\) and \(x = -\frac{3}{13}, y = -\frac{56}{13}\).
Exercise 3D

1 Solve the simultaneous equations:
   a \( x + y = 11 \)
   \( xy = 30 \)
   b \( 2x + y = 1 \)
   \( x^2 + y^2 = 1 \)
   c \( y = 3x \)
   \( 2y^2 - xy = 15 \)
   d \( x + y = 9 \)
   \( x^2 - 3xy + 2y^2 = 0 \)
   e \( 3a + b = 8 \)
   \( 3a^2 + b^2 = 28 \)
   f \( 2u + v = 7 \)
   \( uv = 6 \)

2 Find the coordinates of the points at which the line with equation \( y = x - 4 \) intersects the curve with equation \( y^2 = 2x^2 - 17 \).

3 Find the coordinates of the points at which the line with equation \( y = 3x - 1 \) intersects the curve with equation \( y^2 - xy = 15 \).

4 Solve the simultaneous equations:
   a \( 3x + 2y = 7 \)
   \( x^2 + y = 8 \)
   b \( 2x + 2y = 7 \)
   \( x^2 - 4y^2 = 8 \)

5 Solve the simultaneous equations, giving your answers in their simplest surd form:
   a \( x - y = 6 \)
   \( xy = 4 \)
   b \( 2x + 3y = 13 \)
   \( x^2 + y^2 = 78 \)

3.5 You can solve linear inequalities using similar methods to those for solving linear equations.

- When you multiply or divide an inequality by a negative number, you need to reverse the inequality sign.

Example 9

Find the set of values of \( x \) for which:

a \( 2x - 5 < 7 \)
\( 2x < 12 \)
\( x < 6 \)

b \( 5x + 9 \geq x + 20 \)
\( 4x + 9 \geq 20 \)
\( 4x \geq 11 \)
\( x \geq 2.75 \)

Add 5 to both sides.
Divide both sides by 2.

Subtract \( x \) from both sides.
Subtract 9 from both sides.
Divide both sides by 4.

For c, two approaches are shown:
Subtract 12 from both sides.
Divide both sides by \(-3\). (You therefore need to turn round the inequality sign.)

Add 3x to both sides.
Subtract 27 from both sides.
Divide both sides by 3.
Rewrite with \( x \) on LHS.

c \( 12 - 3x < 27 \)
\(-3x < 15 \)
\( x > -5 \)

\( 12 - 3x < 27 \)
\( 12 < 27 + 3x \)
\(-15 < 3x \)
\(-5 < x \)
\( x > -5 \)
d. \(3(x - 5) > 5 - 2(x - 8)\)
   \[3x - 15 > 5 - 2x + 16\]
   \[5x > 5 + 16 + 15\]
   \[5x > 36\]
   \[x > 7.2\]

Multiply out (note: \(-2 \times -8 = +16\)).
Add 15 to both sides.
Divide both sides by 5.

Example 10
Find the set of values of \(x\) for which:
\(x - 5 > 1 - x\) and \(15 - 3x > 5 + 2x\)

\[
\begin{align*}
x - 5 &> 1 - x \\
2x - 5 &> 1 \\
2x &> 6 \\
x &> 3
\end{align*}
\]

\[
\begin{align*}
15 - 3x &> 5 + 2x \\
10 - 3x &> 2x \\
2 &> x \\
x &< 2
\end{align*}
\]

Draw a number line. Note that there is no overlap between the two sets of values.

So there are no values of \(x\) for which both inequalities are true together.

Exercise 3E

1. Find the set of values of \(x\) for which:
   a. \(2x - 3 < 5\)
   b. \(5x + 4 \geq 39\)
   c. \(6x - 3 > 2x + 7\)
   d. \(5x + 6 \leq -12 - x\)
   e. \(15 - x > 4\)
   f. \(21 - 2x > 8 + 3x\)
   g. \(1 + x < 25 + 3x\)
   h. \(7x - 7 < 7 - 7x\)
   i. \(5 - 0.5x \geq 1\)
   j. \(5x + 4 > 12 - 2x\)

2. Find the set of values of \(x\) for which:
   a. \(2(x - 3) \geq 0\)
   b. \(8(1 - x) > x - 1\)
   c. \(3(x + 7) \leq 8 - x\)
   d. \(2(x - 3) - (x + 12) < 0\)
   e. \(1 + 11(2 - x) < 10(x - 4)\)
   f. \(2(x - 5) \geq 3(4 - x)\)
   g. \(12x - 3(x - 3) < 45\)
   h. \(x - 2(5 + 2x) < 11\)
   i. \(x(x - 4) \geq x^2 + 2\)
   j. \(x(5 - x) \geq 3 + x - x^2\)

3. Find the set of values of \(x\) for which:
   a. \(3(x - 2) > x - 4\) and \(4x + 12 > 2x + 17\)
   b. \(2x - 5 < x - 1\) and \(7(x + 1) > 23 - x\)
   c. \(2x - 3 > 2\) and \(3(x + 2) < 12 + x\)
   d. \(15 - x < 2(11 - x)\) and \(5(3x - 1) > 12x + 19\)
   e. \(3x + 8 \leq 20\) and \(2(3x - 7) \geq x + 6\)
3.6 To solve a quadratic inequality you
- solve the corresponding quadratic equation, then
- sketch the graph of the quadratic function, then
- use your sketch to find the required set of values.

Example 11
Find the set of values of \(x\) for which \(x^2 - 4x - 5 < 0\) and draw a sketch to show this.

\[
x^2 - 4x - 5 = 0
\]
\[
(x + 1)(x - 5) = 0
\]
\[
x = -1 \text{ or } x = 5
\]

-1 and 5 are called critical values.

Your sketch does not need to be accurate. All you really need to know is that the graph is ‘\(-\)'-shaped’ and crosses the \(x\)-axis at \(-1\) and 5.

\[x^2 - 4x - 5 < 0 \text{ (} y < 0 \text{)} \text{ for the part of the graph below the } x\text{-axis, as shown by the paler part in the rough sketch.}\]

So the required set of values is \(-1 < x < 5\).

Example 12
Find the set of values of \(x\) for which \(3 - 5x - 2x^2 < 0\) and sketch the graph of \(y = 3 - 5x - 2x^2\).

\[
3 - 5x - 2x^2 = 0
\]
\[
2x^2 + 5x - 3 = 0
\]
\[
(2x - 1)(x + 3) = 0
\]
\[
x = \frac{1}{2} \text{ or } x = -3
\]

\(\frac{1}{2}\) and \(-3\) are the critical values.

Since the coefficient of \(x^2\) is negative, the graph is ‘upside-down –\(\)'-shaped’ and crosses the \(x\)-axis at \(-3\) and \(\frac{1}{2}\).

\[3 - 5x - 2x^2 < 0 \text{ (} y < 0 \text{)} \text{ for the outer parts of the graph, below the } x\text{-axis, as shown by the paler parts in the rough sketch.}\]

So the required set of values is \(x < -3\) or \(x > \frac{1}{2}\).

You may have to rearrange the quadratic inequality to get all the terms ‘on one side’ before you can solve it, as shown in the next example.
Example 13
Find the set of values of $x$ for which $12 + 4x > x^2$.

1. $12 + 4x > x^2$
   
   $12 + 4x - x^2 > 0$
   
   $x^2 - 4x - 12 = 0$
   
   $(x + 2)(x - 6) = 0$
   
   $x = -2$ or $x = 6$

   Sketch of $y = 12 + 4x - x^2$

   ![Graph of y = 12 + 4x - x^2]

   $12 + 4x - x^2 > 0$
   
   Solution: $-2 < x < 6$

2. $12 + 4x > x^2$
   
   $0 > x^2 - 4x - 12$
   
   $x^2 - 4x - 12 < 0$
   
   $x^2 - 4x - 12 = 0$
   
   $(x + 2)(x - 6) = 0$
   
   $x = -2$ or $x = 6$

   Sketch of $y = x^2 - 4x - 12$

   ![Graph of y = x^2 - 4x - 12]

   $x^2 - 4x - 12 < 0$
   
   Solution: $-2 < x < 6$
Exercise 3F

1. Find the set of values of $x$ for which:
   - a $x^2 - 11x + 24 < 0$
   - b $12 - x - x^2 > 0$
   - c $x^2 - 3x - 10 > 0$
   - d $x^2 + 7x + 12 > 0$
   - e $7 + 13x - 2x^2 > 0$
   - f $10 + x - 2x^2 < 0$
   - g $4x^2 - 8x + 3 = 0$
   - h $-2 + 7x - 3x^2 < 0$
   - i $x^2 - 9 < 0$
   - j $6x^2 + 11x - 10 > 0$
   - k $x^2 - 5x > 0$
   - l $2x^2 + 3x \leq 0$

2. Find the set of values of $x$ for which:
   - a $x^2 < 10 - 3x$
   - b $11 < x^2 + 10$
   - c $x(3 - 2x) > 1$
   - d $x(x + 11) < 3(1 - x^2)$

3.7 You can represent linear inequalities in two variables graphically

Example 14

Find the region satisfied by the following inequalities:

$y \geq 0, \ y - x < 1, \ x + y \leq 3$

First draw some axes and the lines $y = 0, \ y - x = 1$ and $x + y = 3$.

There is a convention that if the inequality is $<$ or $>$ the line is dotted. If the inequality is $\leq$ or $\geq$ the line is solid.

Pick a point $(0,0)$ is usually easy to use, and determine whether your point satisfies each inequality. Shade out the unwanted region.

The following example illustrates a problem in linear programming

Example 15

A manufacturer makes two types of chair and the cost of materials and hours of labour for each chair are given in the table below.

<table>
<thead>
<tr>
<th></th>
<th>Materials</th>
<th>Labour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chair A</td>
<td>£5</td>
<td>2 hours</td>
</tr>
<tr>
<td>Chair B</td>
<td>£7</td>
<td>1.5 hours</td>
</tr>
</tbody>
</table>
The manufacturer has a budget of £140 and 42 hours of labour available. Find the maximum number of chairs that can be made and how many of each type. Let $x = \text{number of chair } A$ 
$y = \text{number of chair } B$

Clearly $x > 0$ and $y > 0$

Cost of materials

$5x + 7y \leq 140$

Time in labour

$2x + 1.5y \leq 42$

Now draw the lines on a graph

Any value in the unshaded region could be manufactured. But the maximum value will be close to one of the vertices of the regions marked $A$, $B$ and $C$.

Point $C$ (21 chairs) is better than point $A$ (20 chairs) so compare $C$ and $B$.

The point $B$ is the intersection of the two lines i.e (13, 10.7).

The point (13, 10) (i.e. 23 chairs) satisfies both inequalities since

Materials cost: £65 + £70 = £135

Labour: 26 + 15 = 41 hours

So the maximum number of chairs is 23, 13 of type $A$ and 10 of type $B$

Check that final position satisfies both inequalities.

Exercise 3G

For Questions 1–8, describe the unshaded region in the graph.
For Questions 9–12, illustrate each inequality on a graph.

9 \[ y \geq 2x, \ x + 2y \leq 4 \text{ and } y + 2x > 1 \]

10 \[ 2y > x, \ y + 2x \leq 4 \text{ and } y > 2x + 2 \]

11 \[ x \geq 0, \ y > 0, \ y < \frac{x}{2} + 4 \text{ and } y \leq 6 - 2x \]

12 \[ x > 0, \ y \geq 0, \ 3x + 4y \leq 12 \text{ and } 5x + 2y \leq 10 \]

13 A club hires a minibus for a pantomime trip.
   The number of passengers must be no more than 14 and the cost of hiring the minibus is £72.
   The club advertises the trip at £8 for children and £12 for adults but insists that there should be more children than adults and at least two adults.
   a Write down some inequalities and represent these graphically to describe the constraints on this trip.
   b Find the smallest-sized group the club can take and still cover the cost of the trip.
   Any money raised over £72 will be used to buy refreshments in the interval.
   c Find the maximum amount that could be available for refreshments and state how many children and adults will be on the trip.

14 The table below gives details of some new machines being installed in a factory and the weekly profit from each machine.

<table>
<thead>
<tr>
<th>Machine</th>
<th>Floor area (m²)</th>
<th>No. of operators</th>
<th>Weekly profit</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>4</td>
<td>2</td>
<td>£100</td>
</tr>
<tr>
<td>B</td>
<td>5</td>
<td>3</td>
<td>£140</td>
</tr>
<tr>
<td>Available resources</td>
<td>100</td>
<td>40</td>
<td></td>
</tr>
</tbody>
</table>

Use a graphical approach to find the number of each machine that should be installed to maximise weekly profit.
15 A manufacturer makes two kinds of ornament. The machine time and craftsman’s time along with the profit for each ornament are shown in the table below.

<table>
<thead>
<tr>
<th>Ornament</th>
<th>Machine Time (h)</th>
<th>Craftsman’s Time (h)</th>
<th>Profit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ornament A</td>
<td>3</td>
<td>1.5</td>
<td>£12</td>
</tr>
<tr>
<td>Ornament B</td>
<td>2</td>
<td>2.5</td>
<td>£15</td>
</tr>
<tr>
<td>Time available</td>
<td>48</td>
<td>45</td>
<td></td>
</tr>
</tbody>
</table>

The manufacturer wishes to maximise profit. Use a graphical approach to find the number of each type of ornament that should be made.

**Mixed Exercise 3H**

1. Solve the simultaneous equations:
   \[ x + 2y = 3 \]
   \[ x^2 - 4y^2 = -33 \]

2. Show that the elimination of \( x \) from the simultaneous equations
   \[ x - 2y = 1 \]
   \[ 3xy - y^2 = 8 \]
   produces the equation
   \[ 5y^2 + 3y - 8 = 0. \]
   Solve this quadratic equation and hence find the pairs \((x, y)\) for which the simultaneous equations are satisfied.

3. Solve the simultaneous equations:
   \[ x + 2y = 3 \]
   \[ x^2 - 2y + 4y^2 = 18 \]

4. a. Solve the inequality \( 3x - 8 > x + 13 \).
   b. Solve the inequality \( x^2 - 5x - 14 > 0 \).

5. Find the set of values of \( x \) for which \((x - 1)(x - 4) < 2(x - 4)\).

6. Find the set of values of \( x \) for which:
   a. \( 6x - 7 < 2x + 3 \)
   b. \( 2x^2 - 11x + 5 < 0 \)
   c. both \( 6x - 7 < 2x + 3 \) and \( 2x^2 - 11x + 5 < 0 \).

7. Find algebraically the set of values of \( x \) for which \((2x - 3)(x + 2) > 3(x - 2)\).

8. Show that \((x - 3)\) is a factor of \( 2x^3 - 2x^2 - 17x + 15 \). Hence express \( 2x^3 - 2x^2 - 17x + 15 \) in the form \((Ax^2 + Bx + C)\), where the values \( A, B \), and \( C \) are to be found.

9. Show that \((x - 2)\) is a factor of \( x^3 + 4x^2 - 3x - 18 \). Hence express \( x^3 + 4x^2 - 3x - 18 \) in the form \((px + q)^2\), where the values \( p \) and \( q \) are to be found.

10. Factorise completely \( 2x^3 + 3x^2 - 18x + 8 \).

11. Find the value of \( k \) if \((x - 2)\) is a factor of \( x^3 - 3x^2 + kx - 10 \).

12. Find the remainder when \( 16x^5 - 20x^4 + 8 \) is divided by \((2x - 1)\).
13 \( f(x) = 2x^2 + px + q. \) Given that \( f(-3) = 0 \) and \( f(4) = 21: \)
   a) find the value of \( p \) and \( q \)
   b) factorise \( f(x) \)

14 \( h(x) = x^3 + 4x^2 + rx + s. \) Given \( h(-1) = 0 \), and \( h(2) = 30: \)
   a) find the value of \( r \) and \( s \)
   b) find the remainder when \( h(x) \) is divided by \( (3x - 1) \)

15 \( g(x) = 2x^3 + 9x^2 - 6x - 5. \)
   a) Factorise \( g(x) \)
   b) Solve \( g(x) = 0 \)

16 The remainder obtained when \( x^3 - 5x^2 + px + 6 \) is divided by \( (x + 2) \) is equal to the remainder obtained when the same expression is divided by \( (x - 3) \).
Find the value of \( p \).

17 The remainder obtained when \( x^3 + dx^2 - 5x + 6 \) is divided by \( (x - 1) \) is twice the remainder obtained when the same expression is divided by \( (x + 1) \).
Find the value of \( d \).

18 a) Show that \( (x - 2) \) is a factor of \( f(x) = x^3 + x^2 - 5x - 2 \).
   b) Hence, or otherwise, find the exact solutions of the equation \( f(x) = 0 \).

19 Given that \(-1\) is a root of the equation \( 2x^3 - 5x^2 - 4x + 3 = 0 \), find the two positive roots.

20 Write down the four pairs of inequalities that describe the regions A, B, C and D.

![Diagram](image)

21 Write down the inequalities that define the unshaded region marked A on the graph.

![Diagram](image)

22 Illustrate the region that satisfies the inequalities \( y \leq x + 3, \ y > 3x - 4 \) and \( y + 2x + 4 > 0 \).
Chapter 3: Summary

1. If \( f(x) \) is a polynomial and \( f(a) = 0 \), then \( (x - a) \) is a factor of \( f(x) \).

2. If \( f(x) \) is a polynomial and \( f\left(\frac{b}{a}\right) = 0 \), then \( (ax - b) \) is a factor of \( f(x) \).

3. If a polynomial \( f(x) \) is divided by \( (ax - b) \) then the remainder is \( f\left(\frac{b}{a}\right) \).

4. When you multiply or divide an inequality by a negative number, you need to reverse the inequality sign.

5. To solve a quadratic inequality:
   - solve the corresponding quadratic equation, then
   - sketch the graph of the quadratic function, then
   - use your sketch to find the required set of values.
### Example 1

Sketch the curve with the equation $y = (x - 2)(x - 1)(x + 1)$

0 = $(x - 2)(x - 1)(x + 1)$

So $x = 2$ or $x = 1$ or $x = -1$

So the curve crosses the x-axis at (2, 0), (1, 0) and (-1, 0).

When $x = 0$, $y = -2 \times -1 \times 1 = 2$

So the curve crosses the y-axis at (0, 2).

Put $y = 0$ and solve for $x$ to find the roots (the points where the curve crosses the x-axis).

Put $x = 0$ to find where the curve crosses the y-axis.

---

When $x$ is large and positive, $y$ is large and positive.

When $x$ is large and negative, $y$ is large and negative.

Check what happens to $y$ for large positive and negative values of $x$.

You can write this as

$x \to \infty$, $y \to \infty$

$x \to -\infty$, $y \to -\infty$

This is called a maximum point because the gradient changes from $+ve$ to $0$ to $-ve$.

$x \to -\infty$, $y \to -\infty$

This is called a minimum point because the gradient changes from $-ve$ to $0$ to $+ve$. 

$x \to -\infty$, $y \to -\infty$
In your exam you will not be expected to work out the coordinates of the maximum or minimum points without further work, but you should mark points where the curve meets the axes.

**Example 2**

Sketch the curves with the following equations and show the points where they cross the coordinate axes.

a \( y = (x - 2)(1 - x)(1 + x) \)

b \( y = x(x + 1)(x + 2) \)

\[ a \quad 0 = (x - 2)(1 - x)(1 + x) \]

So \( x = 2, x = 1 \) or \( x = -1 \)

So the curve crosses the x-axis at (2, 0), (1, 0) and (−1, 0).

Put \( y = 0 \) and solve for \( x \).

When \( x = 0 \), \( y = -2 \times 1 \times 1 = -2 \)

Find the value of \( y \) when \( x = 0 \).

So the curve crosses the y-axis at (0, −2).

Check what happens to \( y \) for large, positive and negative values of \( x \).

Notice that this curve is a reflection in the x-axis of the curve in Example 1.
b \[ y = x(x + 1)(x + 2) \]
\[ 0 = x(x + 1)(x + 2) \]
So \( x = 0, x = -1 \) or \( x = -2 \)

So the curve crosses the x-axis at (0, 0), (−1, 0) and (−2, 0).

\[ x \to \infty, y \to \infty \]
\[ x \to -\infty, y \to -\infty \]

Check what happens to \( y \) for large positive and negative values of \( x \).

---

**Example 3**

Sketch the following curves.

a \[ y = (x - 1)^2(x + 1) \]

b \[ y = x^3 - 2x^2 - 3x \]

a \[ y = (x - 1)^2(x + 1) \]
\[ 0 = (x - 1)^2(x + 1) \]
So \( x = 1 \) or \( x = -1 \).

So the curve crosses the x-axis at (1, 0) and (−1, 0).

When \( x = 0, y = (-1)^2 \cdot 1 = 1 \)  
Find the value of \( y \) when \( x = 0 \).
So the curve crosses the $y$-axis at $(0, 1)$.

\[ x \to \infty, \ y \to \infty \]
\[ x \to -\infty, \ y \to -\infty \]

Check what happens to $y$ for large positive and negative values of $x$.

\[ x = 1 \text{ is a 'double' root.} \]
\[ x \to -\infty, \ y \to -\infty \]

**b** \[ y = x^3 - 2x^2 - 3x \]
\[ = x(x^2 - 2x - 3) \]
\[ = x(x - 3)(x + 1) \]

First factorise.

0 = $x(x - 3)(x + 1)$
So $x = 0, x = 3$ or $x = -1$
So the curve crosses the $x$-axis at $(0, 0), (3, 0)$ and $(-1, 0)$.

So the curve crosses the $y$-axis at $(0, 0)$. 

Exercise 4A

1 Sketch the following curves and indicate clearly the points of intersection with the axes:
   a $y = (x - 3)(x - 2)(x + 1)$
   b $y = (x - 1)(x + 2)(x + 3)$
   c $y = (x + 1)(x + 2)(x + 3)$
   d $y = (x + 1)(1 - x)(x + 3)$
   e $y = (x - 2)(x - 3)(4 - x)$
   f $y = x(x - 2)(x + 1)$
   g $y = x(x + 1)(x - 1)$
   h $y = x(x + 1)(1 - x)$
   i $y = (x - 2)(2x - 1)(2x + 1)$
   j $y = x(2x - 1)(x + 3)$

2 Sketch the curves with the following equations:
   a $y = (x + 1)^2(x - 1)$
   b $y = (x + 2)(x - 1)^2$
   c $y = (2 - x)(x + 1)^2$
   d $y = (x - 2)(x + 1)^2$
   e $y = x^2(x + 2)$
   f $y = (x - 1)^2x$
   g $y = (1 - x)^2(3 + x)$
   h $y = (x - 1)^2(3 - x)$
   i $y = x^2(2 - x)$
   j $y = x^3(x - 2)$

3 Factorise the following equations and then sketch the curves:
   a $y = x^3 + x^2 - 2x$
   b $y = x^3 + 5x^2 + 4x$
   c $y = x^3 + 2x^2 + x$
   d $y = 3x + 2x^2 - x^3$
   e $y = x^3 - x^2$
   f $y = x - x^3$
   g $y = 12x^3 - 3x$
   h $y = x^3 - x^2 - 2x$
   i $y = x^3 - 9x$
   j $y = x^3 - 9x^2$

4.2 You need to be able to sketch and interpret graphs of cubic functions of the form $y = x^3$.

Example 4

Sketch the curve with equation $y = x^3$.

1. $0 = x^3$

   So the curve crosses both axes at (0, 0).

<table>
<thead>
<tr>
<th>$x$</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y = x^3$</td>
<td>-8</td>
<td>-1</td>
<td>0</td>
<td>1</td>
<td>8</td>
</tr>
</tbody>
</table>
As the curve passes the axes at only one point, find its shape by plotting a few points.

Notice that as $x$ increases, $y$ increases rapidly.

The curve is 'flat' at $(0, 0)$. This point is called a point of inflexion. The gradient is positive just before $(0, 0)$ and positive just after $(0, 0)$.

Notice that the shape of this curve is the same as the curve with equation $y = (x + 1)^3$, which is shown in Example 5.

**Example 5**

Sketch the curve with equations:

*a* $y = -x^3$

*b* $y = (x + 1)^3$

*c* $y = (3 - x)^3$

Show their positions relative to the curve with equation $y = x^3$.

**a** $y = -x^3$

You do not need to plot any points. It is quicker if you realise the curve $y = 2x^3$ is a reflection in the $x$-axis of the curve $y = x^3$.

You can check this by looking at the values used to sketch $y = x^3$. So, for example, $x = 2$ will now correspond to $y = -8$ on the curve $y = 2x^3$.

The curve is still flat at $(0, 0)$.

**b** $y = (x + 1)^3$

$0 = (x + 1)^3$

So $x = -1$

So the curve crosses the $x$-axis at $(-1, 0)$.

When $x = 0$, $y = 1^3 = 1$

Put $y = 0$ to find where the curve crosses the $x$-axis.

Put $x = 0$ to find where the curve crosses the $y$-axis.
So the curve crosses the y-axis at (0, 1).

The curve has the same shape as \( y = x^3 \).

You do not need to do any working if you realise the curve \( y = (x + 1)^3 \) is a translation of \(-1\) along the x-axis of the curve \( y = x^3 \).

The point of inflexion is at \((-1, 0)\).

c \[ y = (3 - x)^3 \]

0 = (3 - x)^3

Put \( y = 0 \) to find where the curve crosses the x-axis.

So \( x = 3 \)

So the curve crosses the x-axis at \( (3, 0) \).

When \( x = 0 \), \( y = 3^3 = 27 \) Put \( x = 0 \) to find where the curve crosses the y-axis.

So the curve crosses the y-axis at \( (0, 27) \).

You can write the equation for the curve as \( y = -(x - 3)^3 \) so \( y = -(3 - x)^3 \) so the curve will have the same shape as \( y = -x^3 \).

You do not need to do any working if you realise the curve \( y = (3 - x)^3 = -(x - 3)^3 \) is a translation of \(+3\) along the x-axis of the curve \( y = -x^3 \).

The point of inflexion is at \( (3, 0) \).

---

**Exercise 4B**

1. Sketch the following curves and show their positions relative to the curve \( y = x^3 \):
   - a \( y = (x - 2)^3 \)
   - b \( y = (2 - x)^3 \)
   - c \( y = (x - 1)^3 \)
   - d \( y = (x + 2)^3 \)
   - e \( y = -(x + 2)^3 \)

2. Sketch the following and indicate the coordinates of the points where the curves cross the axes:
   - a \( y = (x + 3)^3 \)
   - b \( y = (x - 3)^3 \)
   - c \( y = (1 - x)^3 \)
   - d \( y = -(x - 2)^3 \)
   - e \( y = -(x - \frac{1}{2})^3 \)
4.3 You need to be able to sketch the reciprocal function $y = \frac{k}{x}$ where $k$ is a constant.

Example 6

Sketch the curve $y = \frac{1}{x}$ and its asymptotes.

$y = \frac{1}{x}$

When $x = 0$, $y$ is not defined.

When $y = 0$, $x$ is not defined.

$x \to +\infty, y \to 0$

$x \to -\infty, y \to 0$

$y \to +\infty, x \to 0$

$y \to -\infty, x \to 0$

The curve does not cross the axes.

The curve tends towards the $x$-axis when $x$ is large and positive or large and negative. The $x$-axis is a horizontal asymptote.

The curve tends towards the $y$-axis when $y$ is large and positive or large and negative. The $y$-axis is a vertical asymptote.

<table>
<thead>
<tr>
<th>$x$</th>
<th>-1</th>
<th>$-\frac{1}{2}$</th>
<th>$-\frac{1}{4}$</th>
<th>$\frac{1}{4}$</th>
<th>$\frac{1}{2}$</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y = \frac{1}{x}$</td>
<td>-1</td>
<td>-2</td>
<td>-4</td>
<td>4</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>

The curve does not cross the $x$-axis or $y$-axis. You need to plot some points.

You can draw a dashed line to indicate an asymptote. (In this case the asymptotes are the axes.)

- The curves with equations $y = \frac{k}{x}$ fall into two categories:

  **Type 1**
  
  $y = \frac{k}{x}, k > 0$

  ![Graph of Type 1 curve]

  - **Type 2**
  
  $y = \frac{k}{x}, k < 0$

  ![Graph of Type 2 curve]
**Example 7**

Sketch on the same diagram:

a. \( y = \frac{4}{x} \) and \( y = \frac{12}{x} \)  

b. \( y = -\frac{1}{x} \) and \( y = -\frac{3}{x} \)

The shape of these curves will be Type 1.

In this quadrant, \( x > 0 \)
so for any values of \( x: \frac{12}{x} > \frac{4}{x} \)

In this quadrant, \( x < 0 \)
so for any values of \( x: \frac{12}{x} > \frac{4}{x} \)

The shape of these curves will be Type 2.

In this quadrant, \( x < 0 \)
so for any values of \( x: \frac{3}{x} > \frac{1}{x} \)

In this quadrant, \( x > 0 \)
so for any values of \( x: \frac{3}{x} < \frac{1}{x} \)

**Exercise 4C**

Use a separate diagram to sketch each pair of graphs.

1. \( y = \frac{2}{x} \) and \( y = \frac{4}{x} \)  
2. \( y = \frac{2}{x} \) and \( y = -\frac{2}{x} \)  
3. \( y = -\frac{4}{x} \) and \( y = -\frac{2}{x} \)

4. \( y = \frac{3}{x} \) and \( y = \frac{8}{x} \)  
5. \( y = -\frac{3}{x} \) and \( y = -\frac{8}{x} \)
4.4 You can sketch curves of functions to show points of intersection and solutions to equations.

Example 8

a On the same diagram sketch the curves with equations \( y = x(x - 3) \) and \( y = x^2(1 - x) \).

b Find the coordinates of the point of intersection.

\[
\begin{align*}
\text{a} & \quad y = x(x - 3) \\
0 & = x(x - 3) \\
\text{Put } y = 0 \text{ and solve for } x.
\end{align*}
\]

So \( x = 0 \) or \( x = 3 \).

So the curve crosses the \( x \)-axis at \((0, 0)\) and \((3, 0)\).

\[
\begin{align*}
\text{b} & \quad y = x^2(1 - x) \\
0 & = x^2(1 - x) \\
\text{Put } y = 0 \text{ and solve for } x \text{ to find where the curve crosses the } x \text{-axis.}
\end{align*}
\]

So \( x = 0 \) or \( x = 1 \).

So the curve crosses the \( x \)-axis at \((0, 0)\) or \((1, 0)\).

The curve crosses the \( y \)-axis at \((0, 0)\).

\[
\begin{align*}
x \to \infty, y & \to -\infty \\
x \to -\infty, y & \to +\infty
\end{align*}
\]

Check what happens to \( y \) for large positive and negative values of \( x \).

A cubic curve is always steeper than a quadratic curve, so it will cross over somewhere on this side of the \( y \)-axis.

b From the graph there are three points where the curves cross, labelled \( A \), \( B \) and \( C \).

The \( x \)-coordinates are given by the solutions to the equation.

\[
\begin{align*}
x(x - 3) & = x^2(1 - x) \\
x^2 - 3x & = x^2 - x^3 \\
x^3 - 3x & = 0 \\
x(x^2 - 3) & = 0 \\
x(x - \sqrt{3})(x + \sqrt{3}) & = 0
\end{align*}
\]

Multiply out brackets.
Collect terms on one side.
Factorise.
Factorise using a difference of 2 squares.

So \( x = -\sqrt{3}, 0, \sqrt{3} \)

You can use the equation \( y = x^2(1 - x) \) to find the \( y \)-coordinates.
So the point where \( x \) is negative is \( A \left(-\sqrt{3}, 3[1 + \sqrt{3}]\right) \), \( B \) is \((0, 0)\) and \( C \) is the point \((\sqrt{3}, 3[1 - \sqrt{3}])\).
Example 9

a  On the same diagram sketch the curves with equations \( y = x^3(x - 1) \) and \( y = \frac{2}{x} \).

b  Explain how your sketch shows that there are two solutions to the equation
\( x^2(x - 1) - \frac{2}{x} = 0 \).

a  \( y = x^3(x - 1) \)
0 = \( x^3(x - 1) \)
So \( x = 0 \) or \( x = 1 \).
So the curve crosses the \( x \)-axis at \((0, 0)\) and \((1, 0)\).
The curve crosses the \( y \)-axis at \((0, 0)\),
\[ x \to \infty, \ y \to \infty \]
\[ x \to \infty, \ y \to -\infty \]
Put \( y = 0 \) and solve for \( x \).
Check what happens to \( y \) for large positive and negative values of \( x \).

b  From the sketch there are only two points of intersection of the curves.
This means there are only two values of \( x \) where
\[ x^2(x - 1) = \frac{2}{x} \]
or \[ x^2(x - 1) - \frac{2}{x} = 0 \]
You would not be expected to solve this equation.

Exercise 4D

1  In each case:
   i  sketch the two curves on the same axes
   ii  state the number of points of intersection
   iii  write down a suitable equation which would give the \( x \)-coordinates of these points.
   (You are not required to solve this equation.)

a  \( y = x^2, \ y = x(x^2 - 1) \)
b  \( y = x(x + 2), \ y = \frac{3}{x} \)
c  \( y = x^3, \ y = (x + 1)(x - 1)^2 \)
d  \( y = x^2(1 - x), \ y = \frac{-2}{x} \)

52
e  \( y = x(x - 4), y = \frac{1}{x} \)

f  \( y = x(x - 4), y = -\frac{1}{x} \)

Hint: In 1f check the point with  
\( x = 2 \) in both curves.

g  \( y = x(x - 4), y = (x - 2)^3 \)

h  \( y = -x^3, y = -\frac{2}{x} \)

i  \( y = -x^3, y = x^2 \)

j  \( y = -x^3, y = -x(x + 2) \)

2  a  On the same axes sketch the curves given by  
\( y = x^2(x - 4) \) and  
\( y = x(4 - x) \).

b  Find the coordinates of the points of intersection.

3  a  On the same axes sketch the curves given by  
\( y = x(2x + 5) \) and  
\( y = x(1 + x)^2 \).

b  Find the coordinates of the points of intersection.

4  a  On the same axes sketch the curves given by  
\( y = (x - 1)^3 \) and  
\( y = (x - 1)(1 + x) \).

b  Find the coordinates of the points of intersection.

5  a  On the same axes sketch the curves given by  
\( y = x^2 \) and  
\( y = -\frac{27}{x^2} \).

b  Find the coordinates of the point of intersection.

6  a  On the same axes sketch the curves given by  
\( y = x^2 - 2x \) and  
\( y = x(x - 2)(x - 3) \).

b  Find the coordinates of the point of intersection.

7  a  On the same axes sketch the curves given by  
\( y = x^2(x - 3) \) and  
\( y = \frac{2}{x} \).

b  Explain how your sketch shows that there are only two solutions to the equation  
\( x^3(x - 3) = 2 \).

8  a  On the same axes sketch the curves given by  
\( y = (x + 1)^3 \) and  
\( y = 3x(x - 1) \).

b  Explain how your sketch shows that there is only one solution to the equation  
\( x^3 + 6x + 1 = 0 \).

9  a  On the same axes sketch the curves given by  
\( y = \frac{1}{x} \) and  
\( y = -x(x - 1)^2 \).

b  Explain how your sketch shows that there are no solutions to the equation  
\( 1 + x^2(x - 1)^2 = 0 \).

10  a  On the same axes sketch the curves given by  
\( y = 1 - 4x^2 \) and  
\( y = x(x - 2)^2 \).

b  State, with a reason, the number of solutions to the equation  
\( x^3 + 4x - 1 = 0 \).

11  a  On the same axes sketch the curve  
\( y = x^3 - 3x^2 - 4x \) and the line  
\( y = 6x \).

b  Find the coordinates of the points of intersection.

12  a  On the same axes sketch the curve  
\( y = (x^2 - 1)(x - 2) \) and the line  
\( y = 14x + 2 \).

b  Find the coordinates of the points of intersection.

13  a  On the same axes sketch the curves with equations  
\( y = (x - 2)(x + 2)^2 \) and  
\( y = -x^2 - 8 \).

b  Find the coordinates of the points of intersection.
4.5 You can apply two or more transformations to sketch more complicated curves

If a curve has equation \( y = f(x) \), then there are 4 basic transformations that you can use.
They are described in terms of translations (a value is added to the \( x \) or \( y \) coordinates) or a stretch (the \( x \) or \( y \) coordinates are multiplied by the value).

\( \text{(1) } f(x + a) \text{ is a horizontal translation of } -a \)
(This means that the value \( a \) is subtracted from all the \( x \) coordinates whilst the \( y \) coordinates stay unchanged. In other words the curve moves \( a \) units to the left.)

\( \text{(2) } f(x) + a \text{ is a vertical translation of } +a \)
(This means that the value \( a \) is added to all the \( y \) coordinates whilst the \( x \) coordinates stay unchanged. In this case the curve moves \( a \) units up.)

\( \text{(3) } f(ax) \text{ is a horizontal stretch of scale factor } \frac{1}{a} \)
(This means that all the \( x \) coordinates are multiplied by \( \frac{1}{a} \) whilst the \( y \) coordinates are left unchanged. The curve is “squashed” in a horizontal direction.)

\( \text{(4) } af(x) \text{ is a vertical stretch of scale factor } a \)
(This means that all the \( y \) coordinates are multiplied by \( a \) but the \( x \) coordinates are left unchanged. The curve is “stretched” in a vertical direction.)

**Example 10**
Sketch the graph of \( y = (x - 2)^2 + 3 \).

Start with \( f(x) = x^2 \)
\[
\begin{align*}
f(x - 2) &= (x - 2)^2 & \text{Step 1 using (1): Horizontal translation of } +2. \\
\text{Calling this } g(x), g(x) &= (x - 2)^2 \\
g(x) + 3 &= (x - 2)^2 + 3 & \text{Step 2 using (2): Vertical translation of } +3.
\end{align*}
\]

Sketch the graph of \( f(x) = x^2 \).

Step 1
Horizontal translation of \( +2 \).

\[
\begin{align*}
\text{Step 1 using (1): Horizontal translation of } +2.
\end{align*}
\]

Sketch the graph of \( y = (x - 2)^2 \).

Step 1
Horizontal translation of \( +2 \).
Example 11
Sketch the graph of \( y = \frac{2}{x + 5} \)

Start with \( f(x) = \frac{1}{x} \)

\[ f(x + 5) = \frac{1}{x + 5} \]

Calling this \( g(x) \), \( g(x) = \frac{1}{x + 5} \)

\[ 2g(x) = \frac{2}{x + 5} \]

**Step 1 using ①:**
Horizontal translation of \(-5\)

**Step 2 using ③:**
Vertical stretch, scale factor 2.

Sketch the graph of \( f(x) = \frac{1}{x} \).
You should notice that the equation of the vertical asymptote has changed in the previous example. The asymptotes for $y = \frac{1}{x}$ are $y = 0$ and $x = 0$ but for $y = \frac{2}{x + 5}$ the horizontal asymptote is still $y = 0$ but the vertical asymptote has changed to $x = -5$ because the whole curve (including its asymptote) has moved 5 units to the left under the transformation $f(x + 5)$.

**Example 12**

Sketch the graph of $y = 3 + \frac{2}{4 - x}$ and state the equations of its asymptotes.

This graph involves several transformations but the basic starting point is a graph of the form $y = \frac{k}{x}$ which you met in Example 7.
The $-x$ term suggests starting with $y = -\frac{2}{x}$ as $y = f(x)$.

The denominator has $4 - x$ so this would be $y = -\frac{2}{x - 4} = \frac{2}{4 - x}$ so that is the transformation $y = f(x - 4)$. So move the curve 4 units to the right.

You should notice that the vertical asymptote has now changed to $x = 4$.

Finally the curve you want to sketch is $y = 3 + \frac{2}{4 - x}$ which is simply the previous curve +3.

This is a $f(x) + 3$ transformation so the previous curve will move up 3 units.

The effect of this final transformation is to alter the equation of the horizontal asymptote to $y = 3$.

So the equations of the asymptotes are $y = 3$ and $x = 4$. 
The following example involves the graphs of trigonometric functions. You may have met the graphs of $y = \sin x$, $y = \cos x$ and $y = \tan x$ in your International GCSE, but they are also covered in Chapter 10.

**Example 13**
Sketch the graph of $y = \cos 2x - 1$.

Start with $f(x) = \cos x$

$f(2x) = \cos 2x$

Calling this $g(x)$, $g(x) = \cos 2x$

$g(x) - 1 = \cos 2x - 1$

**Step 1 using 3:**
Horizontal stretch, scale factor $\frac{1}{2}$.

**Step 2 using 2:**
Vertical translation of $-1$.

Sketch the graph of $f(x) = \cos x$.

**Step 1**
Horizontal stretch, scale factor $\frac{1}{2}$.

**Step 2**
Vertical translation of $-1$. 
Exercise 4E

Sketch the following

1. \( y = 2x^2 - 4 \)
2. \( y = 3(x + 1)^2 \)
3. \( y = \frac{3}{x} - 2 \)
4. \( y = \frac{3}{x - 2} \)
5. \( y = 5 \sin(x + 30^\circ), 0 \leq x \leq 360^\circ \)
6. \( y = 2x^3 - 3 \)
7. \( y = 3 + \frac{1}{x + 1} \)
8. \( y = \frac{1}{x - 2} - 1 \)
9. \( y = 2 + \frac{1}{x - 1} \)
10. \( y = \frac{3 + 2x}{1 + x} \)
11. \( y = 2 + \frac{3}{1 - x} \)
12. \( y = 5 - \frac{2}{3 + x} \)
13. \( y = \frac{3}{2 - x} - 4 \)

**Hint:** Write as
\[
\frac{2 + 2x + 1}{1 + x} = \frac{2(1 + x) + 1}{1 + x}
\] and divide

4.6 You can sketch the graph of the exponential function \( y = e^x \) and transformations of this

Example 14

Sketch the graph of \( f(x) = 2^x \) for the domain \( x \in \mathbb{R} \).

Draw up a table of values.

<table>
<thead>
<tr>
<th>( x )</th>
<th>( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>-2</td>
<td>0.25</td>
</tr>
<tr>
<td>-1</td>
<td>0.5</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>3</td>
<td>8</td>
</tr>
<tr>
<td>4</td>
<td>16</td>
</tr>
<tr>
<td>5</td>
<td>32</td>
</tr>
<tr>
<td>6</td>
<td>64</td>
</tr>
</tbody>
</table>

Plot points on a graph.

The exponential function \( y = e^x \) (where \( e = 2.718 \ldots \)) is a function with a graph very similar to \( y = 2^x \). The value of \( e \) gives special properties that are covered in work in Chapter 9.
Example 15

Draw the graphs of:

a. \( y = e^x \)

b. \( y = e^{-x} \)

A table of values will show you how rapidly this curve grows.

<table>
<thead>
<tr>
<th>x</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>0.14</td>
<td>0.37</td>
<td>1</td>
<td>2.7</td>
<td>7.4</td>
<td>20</td>
<td>55</td>
<td>148</td>
</tr>
</tbody>
</table>

With these curves it is worth keeping in mind:

* - as \( x \rightarrow \infty \), \( e^x \rightarrow \infty \) (it grows very rapidly)
* - when \( x = 0 \), \( e^0 = 1 \) [(0, 1) lies on the curve]
* - as \( x \rightarrow -\infty \), \( e^x \rightarrow 0 \) (it approaches but never reaches the \( x \)-axis).

This curve is similar to the one in part a except that its value at \( x = 2 \) is \( e^{-2} \) and its value at \( x = -2 \) is \( e^2 \).

Hence it is a reflection of the curve of part a in the \( y \)-axis.

The graph in Example 15b is often referred to as exponential decay. It is used as a model in many examples from real life including the fall in value of a car as well as the decay in radioactive isotopes.

Example 16

Draw graphs of the exponential functions:

a. \( y = e^{2x} \)

b. \( y = 10e^{-x} \)

c. \( y = 3 + 4e^{\frac{1}{x}} \)

a. \( y = e^{2x} \)  
\( = (e^x)^2 \)

<table>
<thead>
<tr>
<th>x</th>
<th>-3</th>
<th>0</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>0.002</td>
<td>1</td>
<td>403</td>
</tr>
</tbody>
</table>

If you calculate some values it can give you an idea of the shape of the graph.

The \( y \) values of \( y = e^{2x} \) are the ‘square’ of the \( y \) values of \( y = e^x \).
In Chapter 1 (Section 1.6) you saw the connection between $y = \log_e x$ and $y = e^x$.
Because the function $y = \log_e x$ is particularly important in mathematics it has a special notation

- $\log_e x = \ln x$

Your calculator should have a special button for evaluating $\ln x$

**Example 17**
Solve the equations

a) $e^x = 3$

b) $\ln x = 4$

a) When $e^x = 3$

$x = \ln 3$

The key to solving any equation is knowing the inverse operation.

(e.g. when $x^2 = 10, x = \sqrt{10}$.)

b) When $\ln x = 4$

$x = e^4$

The inverse of $e^x$ is $\ln x$ and vice versa.
**Example 18**

Sketch the graphs of

- **a** \( y = \ln(3 - x) \)
- **b** \( y = 3 + \ln(2x) \)

**a** \( y = \ln(3 - x) \)

When \( x \to 3, y \to -\infty \). The line \( x = 3 \) is an asymptote.

\( y \) does not exist for values of \( x \) bigger than 3.

When \( x = 2, y = \ln(3 - 2) = \ln 1 = 0 \).

As \( x \to -\infty, y \to \infty \) (slowly).

**b** \( y = 3 + \ln(2x) \)

When \( x \to 0, y \to -\infty \).

When \( x = \frac{1}{2}, y = 3 + \ln 1 = 3 \).

As \( x \to \infty, y \to \infty \) (slowly).

---

**Exercise 4F**

1. Sketch the graphs of

   - **a** \( y = e^x + 1 \)
   - **b** \( y = 4e^{-2x} \)
   - **c** \( y = 2e^x - 3 \)
   - **d** \( y = 4 - e^x \)
   - **e** \( y = 6 + 10e^{\frac{1}{2}x} \)
   - **f** \( y = 10e^{-x} + 10 \)

2. Sketch the following graphs stating any asymptotes and intersections with axes:

   - **a** \( y = \ln(x + 1) \)
   - **b** \( y = 2 \ln x \)
   - **c** \( y = \ln(2x) \)
   - **d** \( y = 3\ln(x - 2), x > 2 \)
   - **e** \( y = \ln(4 - x) \)
   - **f** \( y = 3 + \ln(x + 2) \)

---

**4.7 You can use graphs of functions to solve equations**

---

**Example 19**

- **a** Complete the table below of values of \( y = e^{\frac{1}{2}x} - 2 \), giving your answers to 2 decimal places where appropriate.

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>-0.35</td>
<td>0.72</td>
<td>5.39</td>
<td>10.18</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
b  Draw the graph of $y = e^{\frac{1}{2}x} - 2$ for $0 \leq x \leq 5$

c  Use your graph to estimate, to 2 significant figures, the solution of the equation $e^{\frac{1}{2}x} = 8$
    showing your method clearly.

d  By drawing a suitable line on your graph estimate, to 2 significant figures, the solution of the equation $x = 2 \ln(7 - 2x)$

a  
    $x = 0, y = e^0 - 2 = 1 - 2 = -1$
    From calculator
    $x = 3, y = 2.4817... = 2.48$ (2 dp)

b  ![Graph Image]

The blue and purple lines are for parts c and d.

c  
    $\frac{1}{2}x = 8$
    $e^{\frac{1}{2}x} - 2 = 8 - 2$
    $y = 6$

    So solution is intersection of the curve and the line $y = 6$.

    From graph $x \approx 4.15$

    In the exam a range of answers would be allowed say 4.10 - 4.20.

d  
    $x = 2 \ln(7 - 2x)$
    $\frac{x}{2} = \ln(7 - 2x)$
    $e^{\frac{x}{2}} = 7 - 2x$
    $e^{\frac{1}{2}x} - 2 = 7 - 2x - 2$
    $y = 5 - 2x$

    Make LHS equal to the given equation i.e. $e^{\frac{1}{2}x} - 2$.

    Draw the line $y = 5 - 2x$ on your graph and find points of intersection.

    From graph $x \approx 2.1$
Exercise 4G

1. a Complete the table below of values of \( y = 3 + 2e^{-x^{\frac{1}{2}}} \), giving your values of \( y \) to 2 decimal places.

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>

</table>
b Draw the graph of \( y = 5 \sin 2x - 2 \cos x \) for \( 0 \leq x \leq 90 \)

Use your graph to estimate, to 2 significant figures, the solution of the equation

\[
2(1 + \cos x) = 5 \sin 2x
\]

showing your method clearly.

**Mixed Exercise 4H**

1. a On the same axes sketch the graphs of \( y = x^2(x - 2) \) and \( y = 2x - x^2 \).
   
b By solving a suitable equation find the points of intersection of the two graphs.

2. a On the same axes sketch the curves with equations \( y = \frac{6}{x} \) and \( y = 1 + x \).
   
b The curves intersect at the points A and B. Find the coordinates of A and B.
   
c The curve C with equation \( y = x^2 + px + q \), where \( p \) and \( q \) are integers, passes through A and B. Find the values of \( p \) and \( q \).
   
d Add C to your sketch.

3. Sketch the following indicating any intersections with the coordinate axes.
   
a \( y = x^2 - 2x - 3 \) 
   
b \( y = x^2 - 2x + 4 \)

   **Hint:**
   
   b Complete the square.

4. Sketch the following indicating any intersections with the coordinate axes.
   
a \( y = 4x - 3 - x^2 \) 
   
b \( y = 4x - 5 - x^2 \)

5. Sketch the graph of
   
a \( y = \frac{1}{2} e^x + 4 \) 
   
b \( y = \ln(x + 1) + 2 \)

6. a Complete the table below of values of \( y = 1 - \ln(x - 1) \), giving your values of \( y \) to 2 decimal places.

<table>
<thead>
<tr>
<th>x</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>

<td>-0.10</td>
<td></td>
<td>-0.79</td>
<td></td>
</tr>
</tbody>
</table>

   b Draw the graph of \( y = 1 - \ln(x - 1) \) for \( 2 \leq x \leq 7 \)

   c Use your graph to estimate, to 2 significant figures, the solution of the equation

   \[ \ln(x - 1) = 0.8 \]

   showing your method clearly.

   d By drawing a suitable line on your graph estimate, to 2 significant figures, the solution of the equation \( x = 1 + e^{1 - \frac{x}{2}} \).
1. You should know the shapes of the following basic curves.

- $y = x^2$
- $y = x^3$
- $y = (x - a)(x - b)(x - c)$
- $y = \frac{1}{x}$
- $y = e^x$
- $y = \ln x$
2 Transforms:

\( f(x + a) \) is a translation of \(-a\) in the x-direction.

\( f(x) + a \) is a translation of \(+a\) in the y-direction.

\( f(ax) \) is a stretch of \(\frac{1}{a}\) in the x-direction (multiply x-coordinates by \(\frac{1}{a}\)).

\( af(x) \) is a stretch of \(a\) in the y-direction (multiply y-coordinates by \(a\)).
Chapter 5: Series

5.1 A sequence that increases by a constant amount each time is called an arithmetic sequence.

The following are examples of arithmetic sequences:

- 3, 7, 11, 15, 19, ... (because you add 4 each time)
- 2, 7, 12, 17, 22, ... (because you add 5 each time)
- 17, 14, 11, 8, ... (because you add −3 each time)
- \( a, a + d, a + 2d, a + 3d, \ldots \) (because you add \( d \) each time)

- A recurrence relationship of the form
  \[ U_{k+1} = U_k + n , \quad k \geq 1 , \quad n \in \mathbb{Z} \]

is called an arithmetic sequence.

Example 1

Find the a 10th, b \( n \)th and c 50th terms of the arithmetic sequence 3, 7, 11, 15, 19, ...

Sequence is 3, 7, 11, 15, ...

- First term = 3 —— The sequence is going up in fours.
- Second term = 3 + 4 —— It is starting at 3.
- Third term = 3 + 4 + 4 —— The first term is \( 3 + 0 \times 4 \).
- Fourth term = 3 + 4 + 4 + 4 —— The second term is \( 3 + 1 \times 4 \).

a 10th term is
\[ 3 + 9 \times 4 = 3 + 36 = 39 \]
10th term = first term + 9 fours.

b \( n \)th term is
\[ 3 + (n - 1) \times 4 = 4n - 1 \]
\( n \)th term = first term + \((n - 1)\) fours.

c 50th term is
\[ 3 + (50 - 1) \times 4 = 3 + 196 = 199 \]
50th term = first term + 49 fours.

Example 2

A 6 metre high tree is planted in a garden. If it grows 1.5 metres a year:

a How high will it be after it has been in the garden for 8 years?

\[ \frac{6 + 8 \times 1.5}{6 + 12} \]
\[ = 6 + 12 \]
\[ = 18 \text{ metres} \]
It starts at 6 m.

b After how many years will it be 24 metres high?

\[ 24 - 6 = 18 \text{ metres} \]
So number of years = \[ \frac{18}{1.5} \]
\[ = 12 \text{ years} \]
It has 8 years' growth at 1.5 m a year.
It grows at 1.5 metres a year.

Find out how much it has grown in total.
Example 3
Find the number of terms in the arithmetic sequence 7, 11, 15, ..., 143:

The sequence goes up in fours. Work out how to get from one term to the next.
It goes from 7 to 143, a difference of 136.
136 in fours is $\frac{136}{4} = 34$ jumps.

7, 11, 15, ..., 143 Work out the difference between largest and smallest numbers.

There is one more term than the number of jumps, so 34 jumps means 35 terms.

Exercise 5A

1 Which of the following sequences are arithmetic?
   a 3, 5, 7, 9, 11, ...
   b 10, 7, 4, 1, ...
   c y, 2y, 3y, 4y, ...
   d 1, 4, 9, 16, 25, ...
   e 16, 8, 4, 2, 1, ...
   f 1, -1, 1, -1, 1, ...
   g y, y^2, y^3, y^4, ...
   h $U_{n+1} = U_n + 2$, $U_1 = 3$
   i $U_{n+1} = 3U_n - 2$, $U_1 = 4$
   j $U_{n+1} = (U_n)^2$, $U_1 = 2$
   k $U_n = n(n + 1)$
   l $U_n = 2n + 3$

2 Find the 10th and nth terms in the following arithmetic progressions:
   a 5, 7, 9, 11, ...
   b 5, 8, 11, 14, ...
   c 24, 21, 18, 15, ...
   d -1, 3, 7, 11, ...
   e x, 2x, 3x, 4x, ...
   f a, a + d, a + 2d, a + 3d, ...

3 An investor puts £4000 in an account. Every month thereafter she deposits another £200. How much money in total will she have invested at the start of a the 10th month and b the nth month? (Note that at the start of the 6th month she will have made only 5 deposits of £200.)

4 Calculate the number of terms in the following arithmetic sequences:
   a 3, 7, 11, ..., 83, 87
   b 5, 8, 11, ..., 119, 122
   c 90, 88, 86, ..., 16, 14
   d 4, 9, 14, ..., 224, 229
   e x, 3x, 5x, ..., 35x
   f a, a + d, a + 2d, ..., a + (n - 1)d

5.2 Arithmetic series are formed by adding together the terms of an arithmetic sequence, $U_1 + U_2 + U_3 + ... + U_n$.

In an arithmetic series the next term is found by adding (or subtracting) a constant number. This number is called the common difference $d$.
The first term is represented by $a$.

- Therefore all arithmetic series can be put in the form
  $$a + (a + d) + (a + 2d) + (a + 3d) + (a + 4d) + (a + 5d)$$
  1st term 2nd term 3rd term 4th term 5th term 6th term

Look at the relationship between the number of the term and the coefficient of $d$. You should be able to see that the coefficient of $d$ is one less than the number of the term.

We can use this fact to produce a formula for the nth term of an arithmetic series.

- The nth term of an arithmetic series is $a + (n - 1)d$, where $a$ is the first term and $d$ is the common difference.
Example 4

Find **i** the 20th and **ii** the 50th terms of the following series:

**a** \[4 + 7 + 10 + 13 + \ldots\]  
**b** \[100 + 93 + 86 + 79 + \ldots\]

**a** \[4 + 7 + 10 + 13 + \ldots\]  
*In this series \(a = 4\) and \(d = 3\)*

**i** 20th term  
\[
= 4 + (20 - 1) \times 3 \\
= 4 + 19 \times 3 \\
= 61
\]

**ii** 50th term  
\[
= 4 + (50 - 1) \times 3 \\
= 4 + 49 \times 3 \\
= 151
\]

**b** \[100 + 93 + 86 + 79 + \ldots\]  
*In this series \(a = 100\) and \(d = -7\)*

**i** 20th term  
\[
= 100 + (20 - 1) \times -7 \\
= 100 + 19 \times -7 \\
= -33
\]

**ii** 50th term  
\[
= 100 + (50 - 1) \times -7 \\
= 100 + 49 \times -7 \\
= -243
\]

\[d\] is negative this time.

\[d = (93 - 100) = -7.\]

To calculate \(d\) you can use \(U_2 - U_1\) or \(U_3 - U_2\) or \(U_4 - U_3\), etc.

Use the formula \(a + (n - 1)d\), with \(n = 20\) for the 20th term and \(n = 50\) for the 50th term.

Example 5

For the arithmetic series \(5 + 9 + 13 + 17 + 21 + \ldots + 805\):

**a** find the number of terms  

**b** which term of the series would be 129?

Series is \(5 + 9 + 13 + 17 + 21 + \ldots + 805\).

*In this series \(a = 5\) and \(d = 4\).*

**a** Using \(n\)th term \(= a + (n - 1)d\)

\[805 = 5 + (n - 1) \times 4\]
\[805 = 5 + 4n - 4\]
\[805 = 4n + 1\]
\[804 = 4n\]
\[n = 201\]

There are 201 terms in this series.

**b** Using \(n\)th term \(= a + (n - 1)d\)

\[129 = 5 + (n - 1) \times 4\]
\[129 = 4n + 1\]
\[128 = 4n\]
\[n = 32\]

The 32nd term is 129.

A good starting point in all questions is to find the values of \(a\) and \(d\).

Here \(a = 5\) and \(a + d = 9\), so \(d = 4\).

The \(n\)th term is \(a + (n - 1)d\).

So replace \(U_n\) with 805 and solve for \(n\).

Subtract 1.

Divide by 4.

This time the \(n\)th term is 129.

So replace \(U_n\) with 129.

Subtract 1.

Divide by 4.
Example 6
Given that the 3rd term of an arithmetic series is 20 and the 7th term is 12:

a) find the first term

b) find the 20th term.

(Note: These are very popular questions and involve setting up and solving simultaneous equations.)

a) 3rd term = 20, so \( a + 2d = 20 \). \( \quad \text{(1)} \)

7th term = 12, so \( a + 6d = 12 \). \( \quad \text{(2)} \)

Taking (1) from (2):

\[
4d = -8
\]

\[
d = -2
\]

The common difference is \(-2\).

Substitute \( d = -2 \) back into equation (1).

Add 4 to both sides.

The first term is 24.

b) 20th term = \( a + 19d \) \( \quad \text{(3)} \)

= \( 24 + 19 \times -2 \) \( \quad \text{(4)} \)

= \( 24 - 38 \) \( \quad \text{(5)} \)

= \(-14\)

The 20th term is \(-14\).

Exercise 5B

1. Find the 20th and ith the \( n \)th terms of the following arithmetic series:

   a) \( 2 + 6 + 10 + 14 + 18 \ldots \)
   b) \( 4 + 6 + 8 + 10 + 12 \ldots \)
   c) \( 80 + 77 + 74 + 71 + \ldots \)
   d) \( 1 + 3 + 5 + 7 + 9 + \ldots \)
   e) \( 30 + 27 + 24 + 21 + \ldots \)
   f) \( 2 + 5 + 8 + 11 + \ldots \)
   g) \( p + 3p + 5p + 7p + \ldots \)
   h) \( 5x + x + (-3x) + (-7x) + \ldots \)

2. Find the number of terms in the following arithmetic series:

   a) \( 5 + 9 + 13 + 17 + \ldots + 121 \)
   b) \( 1 + 1.25 + 1.5 + 1.75 \ldots + 8 \)
   c) \( -4 + -1 + 2 + 5 \ldots + 89 \)
   d) \( 70 + 61 + 52 + 43 \ldots + -200 \)
   e) \( 100 + 95 + 90 + \ldots + (-1000) \)
   f) \( x + 3x + 5x \ldots + 153x \)

3. The first term of an arithmetic series is 14. If the fourth term is 32, find the common difference.

4. Given that the 3rd term of an arithmetic series is 30 and the 10th term is 9 find \( a \) and \( d \). Hence find which term is the first one to become negative.

5. In an arithmetic series the 20th term is 14 and the 40th term is \(-6\). Find the 10th term.

6. The first three terms of an arithmetic series are \( 5x \), 20 and \( 3x \). Find the value of \( x \) and hence the values of the three terms.

7. For which values of \( x \) would the expression \( -8 \), \( x^2 \) and \( 17x \) form the first three terms of an arithmetic series?

**Hint:**

Question 6 – Find two expressions equal to the common difference and set them equal to each other.
5.3 You can find the sum of an arithmetic series.

The method of finding this sum is attributed to a famous mathematician called Carl Friedrich Gauss (1777–1855). He reputedly solved the following sum whilst in Junior School:

\[ 1 + 2 + 3 + 4 + 5 + \ldots + 98 + 99 + 100 \]

Here is how he was able to work it out:

Let \[ S = 1 + 2 + 3 + 4 \ldots + 98 + 99 + 100 \]

Reversing the sum \[ S = 100 + 99 + 98 + 97 \ldots + 3 + 2 + 1 \]

Adding the two sums \[ 2S = 101 + 101 + 101 + \ldots + 101 + 101 + 101 \]

\[ 2S = 100 \times 101 \]

\[ S = (100 \times 101) \div 2 \]

\[ S = 5050 \]

In general:

\[ S_n = a + (a + d) + (a + 2d) + \ldots + (a + (n - 2)d) + (a + (n - 1)d) \]

Reversing the sum:

\[ S_n = (a + (n - 1)d) + (a + (n - 2)d) + (a + (n - 3)d) + \ldots + (a + d) + a \]

Adding the two sums:

\[ 2S_n = [2a + (n - 1)d] + [2a + (n - 1)d] + \ldots + [2a + (n - 1)d] \]

\[ 2S_n = n[2a + (n - 1)d] \]

\[ S_n = \frac{n}{2} [2a + (n - 1)d] \]

**Hint:** There are \( n \) lots of \( 2a + (n - 1)d \).

Prove for yourself that it could be \( S_n = \frac{n}{2} (a + L) \) where \( L = a + (n - 1)d \).

- The formula for the sum of an arithmetic series is
  \[ S_n = \frac{n}{2} [2a + (n - 1)d] \]

  or \[ S_n = \frac{n}{2} (a + L) \]

  where \( a \) is the first term, \( d \) is the common difference, \( n \) is the number of terms and \( L \) is the last term in the series.

---

**Example 7**

Find the sum of the first 100 odd numbers.

\[ S = 1 + 3 + 5 + 7 + \ldots \]

\[ = \frac{n}{2} [2a + (n - 1)d] \]

\[ = \frac{100}{2} [2 \times 1 + (100 - 1)2] \]

\[ = 50[2 + 198] \]

\[ = 50 \times 200 \]

\[ = 10000 \]

This can be found simply using the formula

\[ S = \frac{n}{2} [2a + (n - 1)d] \]

with \( a = 1 \), \( d = 2 \) and \( n = 100 \).
\[ L = a + (n - 1)d \]
\[ = 1 + 99 \times 2 \]
\[ = 199 \]
\[ S = \frac{n}{2}(a + L) \]
\[ = \frac{100}{2}(1 + 199) \]
\[ = 10000 \]

Alternatively, find \( L \) and use
\[ S = \frac{n}{2}(a + L) \]

This is a very useful formula and is well worth remembering.

You will not be asked to prove these formulae.

**Example 8**

Find the greatest number of terms required for the sum of 4 + 9 + 14 + 19 + ...

to exceed 2000.

4 + 9 + 14 + 19 + ... > 2000

Using \[ S = \frac{n}{2}[2a + (n - 1)d] \]

2000 = \[ \frac{n}{2}[2 \times 4 + (n - 1)5] \]

4000 = \[ n(8 + 5n - 5) \]

4000 = \[ n(5n + 3) \]

4000 = \[ 5n^2 + 3n \]

0 = \[ 5n^2 + 3n - 4000 \]

\[ n = \frac{-3 \pm \sqrt{(9 + 80000)}}{10} \]

\[ = 27.9, -28.5 \]

28 terms are needed.

Always establish what you are given in a question. As you are adding on positive terms, it is easier to solve the equality \( S_n = 2000 \).

Knowing \( a = 4 \), \( d = 5 \) and \( S_n = 2000 \), you need to find \( n \).

Substitute into \[ S = \frac{n}{2}[2a + (n - 1)d] \].

Solve using formula \[ n = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \]

Accept positive answer and round up.

**Example 9**

Robert starts his new job on a salary of \( £15000 \). He is promised rises of \( £1000 \) a year, at the end of every year, until he reaches his maximum salary of \( £25000 \).

Find his total earnings (since appointed) after \( a \) 8 years with the firm and \( b \) 14 years with the firm.

\( a \) Total earnings

\[ = £15000 + £16000 + \ldots \) (for 8 years) \]

\[ a = 15000, d = 1000 \text{ and } n = 8 \]

\[ S = \frac{n}{2}[2a + (n - 1)d] \]

\[ S = \frac{8}{2}[30000 + 7 \times 1000] \]

\[ = £148000 \]

Note that it will take Robert 11 years to reach his maximum (his first year and 10 wage rises).

Write down what you know.

Use \[ S = \frac{n}{2}[2a + (n - 1)d] \]
b Total earnings
\[
= \mathbf{\£}15\,000 + \mathbf{\£}16\,000 + \ldots + \mathbf{\£}25\,000 + \mathbf{\£}25\,000 + \mathbf{\£}25\,000 + \mathbf{\£}25\,000
\]
\[a = 15\,000, \quad d = 1000\] and
\[n = 11\] for the first 11 years.
\[
S = \frac{n}{2}[2a + (n - 1)d]
\]
\[
= \frac{11}{2}[30\,000 + 10 \times 1000]
\]
\[= \mathbf{\£}220\,000\]
3 years at \mathbf{£}25\,000 = \mathbf{\£}75\,000.
Total amount earned = \mathbf{\£}295\,000.

Example 10

Show that the sum of the first \(n\) natural numbers is \(\frac{1}{2}n(n + 1)\).

This is an arithmetic series with
\[a = 1, \quad d = 1, \quad n = n.\]
\[
S = \frac{n}{2}[2a + (n - 1)d]
\]
\[
= \frac{n}{2}[2 \times 1 + (n - 1) \times 1]
\]
\[= \frac{n}{2}(2 + n - 1)
\]
\[= \frac{n}{2}(n + 1)
\]
\[= \frac{1}{2}n(n + 1)\]

Exercise 5C

1 Find the sums of the following series:
   a \(3 + 7 + 11 + 14 + \ldots\) (20 terms)
   b \(2 + 6 + 10 + 14 + \ldots\) (15 terms)
   c \(30 + 27 + 24 + 21 + \ldots\) (40 terms)
   d \(5 + 1 + 3 + 7 + \ldots\) (14 terms)
   e \(5 + 7 + 9 + \ldots + 75\)
   f \(4 + 7 + 10 + \ldots + 91\)
   g \(34 + 29 + 24 + 19 + \ldots + 11\)
   h \((x + 1) + (2x + 1) + (3x + 1) + \ldots + (21x + 1)\)

2 Find how many terms of the following series are needed to make the given sum:
   a \(5 + 8 + 11 + 14 + \ldots = 670\)
   b \(3 + 8 + 13 + 18 + \ldots = 1575\)
   c \(64 + 62 + 60 + \ldots = 0\)
   d \(34 + 30 + 26 + 22 + \ldots = 112\)

3 Find the sum of the first 50 even numbers.

4 Carol starts a new job on a salary of \(\mathbf{\£}20\,000\). She is given an annual wage rise of \(\mathbf{\£}500\) at the end of every year until she reaches her maximum salary of \(\mathbf{\£}25\,000\). Find the total amount she earns (assuming no other rises), a in the first 10 years and b over 15 years.
5 Find the sum of the multiples of 3 less than 100. Hence or otherwise find the sum of the numbers less than 100 which are not multiples of 3.

6 James decides to save some money during the six-week holiday. He saves 1p on the first day, 2p on the second, 3p on the third and so on. How much will he have at the end of the holiday (42 days)? If he carried on, how long would it be before he has saved £100?

7 The first term of an arithmetic series is 4. The sum to 20 terms is −15. Find, in any order, the common difference and the 20th term.

8 The sum of the first three numbers of an arithmetic series is 12. If the 20th term is −32, find the first term and the common difference.

9 Show that the sum of the first 2n natural numbers is n(2n + 1).

10 Prove that the sum of the first n odd numbers is n².

5.4 You can use Σ to signify 'the sum of'.

For example:

\[ \sum_{n=1}^{10} 2n \text{ means the sum of } 2n \text{ from } n = 1 \text{ to } n = 10 \]

\[ = 2 + 4 + 6 + 8 + 10 + 12 + 14 + 16 + 18 + 20 \]

\[ \sum_{n=1}^{10} U_n = U_1 + U_2 + U_3 + \ldots + U_{10} \]

\[ \sum_{r=0}^{10} (2 + 3r) \text{ means the sum of } (2 + 3r) \text{ from } r = 0 \text{ to } r = 10 \]

\[ = 2 + 5 + 8 + \ldots + 32 \]

\[ \sum_{r=5}^{15} (10 - 2r) \text{ means the sum of } (10 - 2r) \text{ from } r = 5 \text{ to } r = 15 \]

\[ = 0 + -2 + -4 + \ldots + -20 \]

**Example 11**

Calculate \( \sum_{r=1}^{20} (4r + 1) \)

= 5 + 9 + 13 + \ldots + 81

\[ S = \frac{n}{2} [2a + (n - 1)d] \]

\[ = \frac{20}{2} [2 \times 5 + (20 - 1)4] \]

\[ = 10[10 + (19) \times 4] \]

\[ = 10 \times 86 \]

\[ = 860 \]

Substitute \( r = 1, 2, \) etc. to find terms in series.

Substitute \( a = 5, d = 4 \) and \( n = 20 \) into

\[ S = \frac{n}{2} [2a + (n - 1)d]. \]
Exercise 5D

1. Rewrite the following sums using $\sum$ notation:
   - $a\ 4 + 7 + 10 + \ldots + 31$
   - $c\ 40 + 36 + 32 + \ldots + 0$
   - $b\ 2 + 5 + 8 + 11 + \ldots + 89$
   - $d\ The\ multiples\ of\ 6\ less\ than\ 100$

2. Calculate the following:
   - $a\ \sum_{r=1}^{5} 3r$
   - $c\ \sum_{r=1}^{20} (5r - 2)$
   - $b\ \sum_{r=1}^{10} (4r - 1)$
   - $d\ \sum_{r=0}^{5} r(r + 1)$

3. For what value of $n$ does $\sum_{r=1}^{n} (5r + 3)$ first exceed 1000?

4. For what value of $n$ would $\sum_{r=1}^{n} (100 - 4r) = 0$?

5.5 The following sequences are called geometric sequences. To get from one term to the next we multiply by the same number each time. This number is called the common ratio, $r$.

   $1, 2, 4, 8, 16, \ldots$
   $100, 25, 6.25, 1.5625, \ldots$
   $2, -6, 18, -54, 162, \ldots$

Example 12

Find the common ratios in the following geometric sequences:

- **a** 2, 10, 50, 250, ...
- **b** 90, -30, 10, -3 1/3

\[
\text{Common ratio} = \frac{10}{2} = 5
\]

Use $u_1, u_2, \text{etc.}$ to refer to the individual terms in a sequence. Here $u_1 = 2, u_2 = 10, u_3 = 50$.

To find the common ratio calculate $\frac{u_2}{u_1}$ or $\frac{u_3}{u_2}$.

\[
\text{Common ratio} = \frac{-30}{90} = -\frac{1}{3}
\]

A common ratio can be negative or a fraction (or both).

Exercise 5E

1. Which of the following are geometric sequences? For the ones that are, give the value of 'r' in the sequence:
   - **a** 1, 2, 4, 8, 16, 32, ...
   - **b** 2, 5, 8, 11, 14, ...
   - **c** 40, 36, 32, 28, ...
   - **d** 2, 6, 18, 54, 162, ...
   - **e** 10, 5, 2.5, 1.25, ...
   - **f** 5, -5, 5, -5, 5, ...
   - **g** 3, 3, 3, 3, 3, 3, 3, 3, ...
   - **h** 4, -1, 0.25, -0.0625, ...
2. Continue the following geometric sequences for three more terms:
   a) 5, 15, 45, ...
   b) 4, -8, 16, ...
   c) 60, 30, 15, ...
   d) 1, $\frac{1}{4}$, $\frac{1}{16}$, ...
   e) 1, $p$, $p^2$, ...
   f) $x$, $-2x^2$, $4x^3$, ...

3. If 3, $x$, and 9 are the first three terms of a geometric sequence, find:
   a) the exact value of $x$,
   b) the exact value of the 4th term.

**Hint for question 3:**
In a geometric sequence the common ratio can be calculated by $\frac{u_2}{u_1}$ or $\frac{u_3}{u_2}$.

5.6 You can define a geometric sequence using the first term $a$ and the common ratio $r$:

- $a$, $ar$, $ar^2$, $ar^3$, ..., $ar^{n-1}$
- 1st term, 2nd term, 3rd term, 4th term, nth term

**Example 13**
Find the i 10th and ii nth terms in the following geometric sequences:

a) 3, 6, 12, 24, ...
   i) 10th term = $3 \times (2)^9 = 3 \times 512 = 1536$
   ii) nth term = $3 \times 2^{n-1}$

b) 40, -20, 10, -5, ...
   i) 10th term = $40 \times (-\frac{1}{2})^9 = 40 \times -\frac{1}{512} = -\frac{5}{64}$
   ii) nth term = $40 \times (-\frac{1}{2})^{n-1}$

For this sequence $a = 3$ and $r = \frac{0}{3} = 2$.
For the 10th term use $ar^{n-1}$ with $a = 3$,
$r = 2$ and $n = 10$.
For the nth term use $ar^{n-1}$ with $a = 3$ and $r = 2$.
For this sequence $a = 40$ and $r = -\frac{20}{40} = -\frac{1}{2}$.
Use $ar^{n-1}$ with $a = 40$, $r = -\frac{1}{2}$ and $n = 10$.
Use $ar^{n-1}$ with $a = 40$, $r = -\frac{1}{2}$ and $n = n$.
Use laws of indices $\frac{x^m}{x^n} = \frac{1}{x^{m-n}}$.
So $2^3 \times \frac{1}{2^n-1} = \frac{1}{2^{n-1}-3}$. 

**Hint**
Look at the relationship between the position of the term in the sequence and the index of the term. You should be able to see that the index of $r$ is one less than its position in the sequence. 
So the nth term of a geometric sequence is $ar^{n-1}$. 

Sometimes a geometric sequence is called a geometric progression.
Example 14

The second term of a geometric sequence is 4 and the 4th term is 8.
Find the exact values of a the common ratio, b first term and c the 10th term:

\[ \text{a} \quad \text{2nd term} = 4, \ ar = 4 \]
\[ \text{4th term} = 6, \ ar^3 = 8 \]
\[ 2 \div 1 \quad r^2 = 2 \]
\[ r = \sqrt{2} \]
So \( \text{common ratio} = \sqrt{2} \)

\[ \text{b} \quad \text{Substitute back in} \ ① \ a\sqrt{2} = 4 \]
\[ a = \frac{4}{\sqrt{2}} \]
\[ = \frac{4\sqrt{2}}{2} \]
\[ a = 2\sqrt{2} \]
So first term = \( 2\sqrt{2} \)

\[ \text{c} \quad \text{10th term} = ar^9 \]
\[ = 2\sqrt{2} (\sqrt{2})^9 \]
\[ = 2(\sqrt{2})^{10} \]
\[ = 2 \times 2^5 \]
\[ = 2^6 \]
\[ = 64 \]
So 10th term = 64

Example 15

The numbers 3, \( x \) and \((x + 6)\) form the first three terms of a positive geometric sequence.
Find:

\[ \text{a} \quad \text{the possible values of} \ x, \quad \text{b} \quad \text{the 10th term of the sequence.} \]

\[ \text{a} \quad \frac{u_2}{u_1} = \frac{u_3}{u_2} \quad \text{The sequence is geometric so} \quad \frac{u_2}{u_1} = \frac{u_3}{u_2} \]
\[ \frac{x}{3} = \frac{x + 6}{x} \quad \text{Cross multiply.} \]
\[ x^2 = 3(x + 6) \]
\[ x^2 = 3x + 18 \]
\[ x^2 = 3x - 18 = 0 \]
\[ (x - 6)(x + 3) = 0 \]
\[ x = 6 \text{ or } -3 \]
So \( x \) is either 6 or -3, but there are no negative terms so \( x = 6 \).
Accept \( x = 6 \), as terms are positive.
b \quad 10\text{th term} = ar^9 \\
= 3 \times 2^9 \\
= 3 \times 512 \\
= 1536 \\
Use the formula $n$th term $= ar^{n-1}$ with $n = 9, a = 3$ and $r = \frac{x}{3} = \frac{6}{3} = 2$.

The 10th term is 1536.

**Exercise 5F**

1. Find the sixth, tenth and $n$th terms of the following geometric sequences:
   - a \quad 2, 6, 18, 54, ...
   - b \quad 100, 50, 25, 12.5, ...
   - c \quad 1, -2, 4, -8, ...
   - d \quad 1, 1.1, 1.21, 1.331, ...

2. The $n$th term of a geometric sequence is $2 \times (5)^n$. Find the first and 5th terms.

3. The sixth term of a geometric sequence is 32 and the 3rd term is 4. Find the first term and the common ratio.

4. Given that the first term of a geometric sequence is 4 and the third is 1, find possible values for the 6th term.

5. The expressions $x - 6, 2x$ and $x^2$ form the first three terms of a geometric progression. By calculating two different expressions for the common ratio, form and solve an equation in $x$ to find possible values of the first term.

5.7 \text{ You need to be able to find the sum of a geometric series.}

**Example 16**

Find the general term for the sum of the first $n$ terms of a geometric series $a, ar, ar^2, \ldots, ar^{n-1}$.

Let $S_n = a + ar + ar^2 + ar^3 + \ldots + ar^{n-1}$ \quad \text{(1)}

$rS_n = ar + ar^2 + ar^3 + \ldots + ar^{n-1} + ar^n$ \quad \text{(2)}

Multiply by $r$.

\begin{align*}
\text{\textcircled{1}} - \text{\textcircled{2}} \quad &S_n - rS_n = a - ar^n \\
\quad &S_n(1 - r) = a(1 - r^n) \\
\quad &S_n = \frac{a(1 - r^n)}{1 - r}
\end{align*}

Subtract $rS_n$ from $S_n$.

Take out the common factor.

Divide by $(1 - r)$.

- The general rule for the sum of a geometric series is

$$S_n = \frac{a(r^n - 1)}{r - 1} \quad \text{or} \quad \frac{a(1 - r^n)}{1 - r}$$

You will not be asked to prove these formulae.
Example 17

Find the sum of the following series:

a \quad 2 + 6 + 18 + 54 + \ldots \text{ (for 10 terms)}

b \quad 1024 - 512 + 256 - 128 + \ldots + 1

a Series is
\[ 2 + 6 + 18 + 54 + \ldots \text{ (for 10 terms)} \]
So \( a = 2, \ r = \frac{6}{2} = 3 \) and \( n = 10 \)
So \( S_{10} = \frac{2(3^{10} - 1)}{3 - 1} = 59048 \)

As in all questions, write down what is given.
As \( r = 3 \ (> 1) \), it is easier to use the formula \( S_n = \frac{a(r^n - 1)}{r - 1} \) as it avoids minus signs.

b Series is
\[ 1024 - 512 + 256 - 128 + \ldots + 1 \]
So \( a = 1024, \ r = -\frac{512}{1024} = -\frac{1}{2} \)
and \( n\)th term = 1
\[
1024(-\frac{1}{2})^{n-1} = 1 \\
(-2)^{n-1} = 1024 \\
2^{n-1} = 1024 \\
\log 2^n = \log 1024 \\
n - 1 = \log 1024 \log 2 \\
n - 1 = 10 \\
n = 11
\]
So \( S_{11} = \frac{1024[1 - \left(-\frac{1}{2}\right)^{11}]}{1 - \left(-\frac{1}{2}\right)} = \frac{1024(1 + \frac{1}{2048})}{1 + \frac{1}{2}} = \frac{1024.5}{\frac{3}{2}} = 683 \)

First solve \( ar^{n-1} = 1 \) to find \( n \).
\((-2)^{n-1} = (-1)^n - 1(2^{n-1}) = 1024. \)
so \((-1)^n - 1\) must be positive and \(2^{n-1} = 1024. \)
1024 = 2\(^{10}\)
As \( r = -\frac{1}{2} \ (< 1) \) we use the formula \( S_n = \frac{a(1 - r^n)}{1 - r}. \)

Example 18

An investor invests £2,000 on January 1st every year in a savings account that guarantees him 4% per annum for life. If interest is calculated on the 31st of December each year, how much will be in the account at the end of the 10th year?

End of year 1, amount = 2000 \times 1.04 
Start of year 2, amount = 2000 \times 1.04 + 2000 
End of year 2, amount = (2000 \times 1.04 + 2000) \times 1.04 
Start of year 3, amount = 2000 \times 1.04^2 + 2000 \times 1.04 + 2000 

A rate of 4% means \( \times 1.04. \) 
Every new year he invests £2,000. 
At the end of every year the total amount in the account is multiplied by 1.04.
End of year 3.
amount = \((2000 \times 1.04^2 + 2000 \times 1.04 + 2000) \times 1.04\)
= \(2000 \times 1.04^3 + 2000 \times 1.04^2 + 2000 \times 1.04\)

So by end of year 10. Look at the values for the end of year 3 and extend this for 10 years.
amount = \(2000 \times 1.04^{10} + 2000 \times 1.04^9 + \ldots + 2000 \times 1.04\)
= \(2000 \times \frac{1.04^{10} - 1}{1.04 - 1}\)
= \(2000 \times 12.486 \ldots = £24,972.70\)

This is a geometric series. Substitute \(a = 1.04\), \(r = 1.04\) and \(n = 10\) in \(S\)
\[
S_n = \frac{a(r^n - 1)}{r - 1}
\]

**Example 19**

Find the least value of \(n\) such that the sum of \(1 + 2 + 4 + 8 + \ldots\) to \(n\) terms would exceed \(2,000,000\).

Sum to \(n\) terms is \(S_n = \frac{2^n - 1}{2 - 1}\)
= \(2^n - 1\)

If this is to exceed \(2,000,000\) then
\[
S_n > 2,000,000
\]
\[
2^n - 1 > 2,000,000
\]
\[
2^n > 2,000,001
\]

Add 1.
\[
n \log(2) > \log(2,000,001)
\]
\[
n > \frac{\log(2,000,001)}{\log(2)}
\]
Use laws of logs: \(\log_c c^n = n \log_c c\).
\[
n > 20.9
\]
It needs 21 terms to exceed \(2,000,000\) Round up \(n\) to the nearest integer.

**Example 20**

Find \(\sum_{r=1}^{10} (3 \times 2^r)\).

\[
S_{10} = \sum_{r=1}^{10} (3 \times 2^r)
\]
‘\(\sum\)’ means ‘sum of’ – in this case the sum of \((3 \times 2^r)\) from \(r = 1\) to \(r = 10\).
\[
= 3 \times 2^1 + 3 \times 2^2 + 3 \times 2^3 + \ldots + 3 \times 2^{10}
\]
\[
= 3(2^1 + 2^2 + 2^3 + \ldots + 2^{10})
\]
This is a geometric series with \(a = 2, r = 2\) and \(n = 10\).
\[
= 3 \times 2 \frac{2^{10} - 1}{2 - 1}
\]
Use \(s = \frac{a(r^n - 1)}{r - 1}\)
So \(S_{10} = 6138\)
Exercise 5G

1. Find the sum of the following geometric series (to 3 d.p. if necessary):
   a. $1 + 2 + 4 + 8 + \ldots$ (8 terms)
   b. $32 + 16 + 8 + \ldots$ (10 terms)
   c. $4 - 12 + 36 - 108 \ldots$ (6 terms)
   d. $729 - 243 + 81 - \ldots$ $\frac{-1}{3}$
   e. $\sum_{r=1}^{6} 4^r$
   f. $\sum_{r=1}^{8} 2 \times (3)^r$
   g. $\sum_{r=1}^{10} 6 \times (\frac{1}{2})^r$
   h. $\sum_{r=1}^{6} 60 \times (-\frac{1}{3})^r$

2. The sum of the first three terms of a geometric series is 30.5. If the first term is 8, find possible values of $r$.

3. The man who invented the game of chess was asked to name his reward. He asked for 1 grain of corn to be placed on the first square of his chessboard, 2 on the second, 4 on the third and so on until all 64 squares were covered. He then said he would like as many grains of corn as the chessboard carried. How many grains of corn did he claim as his prize?

4. Jane invests £40000 at the start of every year. She negotiates a rate of interest of 4% per annum, which is paid at the end of the year. How much is her investment worth at the end of a. the 10th year and b. the 20th year?

5. A ball is dropped from a height of 10 m. It bounces to a height of 7 m and continues to bounce. Subsequent heights to which it bounces follow a geometric sequence. Find out:
   a. how high it will bounce after the fourth bounce,
   b. the total distance travelled until it hits the ground for the sixth time.

6. Find the least value of $n$ such that the sum $3 + 6 + 12 + 24 + \ldots$ to $n$ terms would first exceed 1.5 million.

7. Find the least value of $n$ such that the sum $5 + 4.5 + 4.05 + \ldots$ to $n$ terms would first exceed 45.

8. Richard is sponsored to cycle 1000 miles over a number of days. He cycles 10 miles on day 1, and increases this distance by 10% a day. How long will it take him to complete the challenge? What was the greatest number of miles he completed in a single day?

9. A savings scheme is offering a rate of interest of 3.5% per annum for the lifetime of the plan. Alan wants to save up £20 000. He works out that he can afford to save £500 every year, which he will deposit on 1 January. If interest is paid on 31 December, how many years will it be before he has saved up his £20 000?
5.8 You need to be able to find the sum to infinity of a convergent geometric series.

Consider the series \( S = 3 + 1.5 + 0.75 + 0.375 + \ldots \)

No matter how many terms of the series you take, the sum never exceeds a certain number. We call this number the limit of the sum, or more often, its sum to infinity.

We can find out what this limit is.

As \( a = 3 \) and \( r = \frac{1}{2} \), \( S = \frac{a(1 - r^n)}{1 - r} = \frac{3(1 - (\frac{1}{2})^n)}{1 - \frac{1}{2}} = 6(1 - (\frac{1}{2})^n) \)

If we replace \( n \) with certain values to find the sum we find that
- when \( n = 3 \), \( S_3 = 5.25 \)
- when \( n = 5 \), \( S_5 = 5.8125 \)
- when \( n = 10 \), \( S_{10} = 5.9994 \)
- when \( n = 20 \), \( S_{20} = 5.999994 \)

You can see that as \( n \) gets larger, \( S \) becomes closer and closer to 6.

We say that this infinite series is **convergent**, and has a sum to infinity of 6. Convergent means the series tends towards a specific value as more terms are added.

Not all series converge. The reason that this one does is that the terms of the sequence are getting smaller.

This happens because \(-1 < r < 1\).

The sum to infinity of a series exists only if \(-1 < r < 1\).

\[ S = \frac{a(1 - r^n)}{1 - r} \]

*Hint: You can write ‘the sum to infinity’ is \( S_\infty \).

\[ S_\infty = \frac{a}{1 - r} \]

- **The sum to infinity of a geometric series is** \( \frac{a}{1 - r} \) **if** \(|r| < 1\). 

*Hint: \(|r| \) means \(-1 < r < 1\).*

**Example 21**

Find the sums to infinity of the following series:

- **a** \( 40 + 10 + 2.5 + 0.625 + \ldots \)
- **b** \( 1 + \frac{1}{p} + \frac{1}{p^2} + \ldots \)

**a** \( 40 + 10 + 2.5 + 0.625 + \ldots \)

In this series \( a = 40 \) and \( r = \frac{10}{40} = \frac{1}{4} \)

\(-1 < r < 1\), so \( S_\infty \) exists

\[ S = \frac{a}{1 - r} = \frac{40}{1 - \frac{1}{4}} = \frac{40}{\frac{3}{4}} = \frac{160}{3} \]

Always write down the values of \( a \) and \( r \), using \( \frac{a_2}{a_1} \) for \( r \).

\(-1 < r < 1\), so \( S_\infty \) exists

\[ S = \frac{a}{1 - r} = \frac{40}{1 - \frac{1}{4}} = \frac{40}{\frac{3}{4}} = \frac{160}{3} \]

Substitute \( a = 40 \) and \( r = \frac{10}{4} = \frac{1}{4} \)

into \( S = \frac{a}{1 - r} \).
\[ b \quad 1 + \frac{1}{p} + \frac{1}{p^2} + \ldots \]

In this series \( a = 1 \) and \( r = \frac{a_2}{a_1} = \frac{\frac{1}{p}}{1} = \frac{1}{p} \)

\( S \) will exist if \( \left| \frac{1}{p} \right| < 1 \) so \( p > 1 \).

If \( p > 1 \), \( S_\infty = \frac{1}{1 - \frac{1}{p}} = \frac{p}{p - 1} \)

Multiply top and bottom by \( p \).

**Example 22**

The sum to 4 terms of a geometric series is 15 and the sum to infinity is 16.

**a** Find the possible values of \( r \).

**b** Given that the terms are all positive, find the first term in the series.

\[ a \quad \frac{a(1 - r^4)}{1 - r} = 15 \quad (1) \]

\[ S_4 = 15 \text{ so use the formula } S_n = \frac{a(1 - r^n)}{1 - r} \text{ with } n = 4. \]

\[ \frac{a}{1 - r} = 16 \quad (2) \]

\[ S_\infty = 16 \text{ so use the formula } S_\infty = \frac{a}{1 - r} \text{ with } S_\infty = 16. \]

\[ 16(1 - r^4) = 15 \]

\[ 1 - r^4 = \frac{15}{16} \]

\[ r^4 = \frac{1}{16} \]

\[ r = \pm \frac{1}{2} \]

Solve equations simultaneously.

Replace \( \frac{a}{1 - r} \) by 16 in equation \( (1) \)

Divide by 16.

Rearrange.

Take the 4th root of \( \frac{1}{16} \).

\[ \text{As all terms positive, } r = \frac{1}{2} \]

Substitute \( r = \frac{1}{2} \) back into equation \( (2) \) to find \( a \)

\[ \frac{a}{1 - \frac{1}{2}} = 16 \]

\[ 16(1 - \frac{1}{2}) = a \]

\[ a = 8 \]

The first term in the series is 8.

**Exercise 5H**

\[ \text{1} \quad \text{Find the sum to infinity, if it exists, of the following series:} \]

**a** \[ 1 + 0.1 + 0.01 + 0.001 + \ldots \]

**b** \[ 1 + 2 + 4 + 8 + 16 + \ldots \]

**c** \[ 10 - 5 + 2.5 - 1.25 + \ldots \]

**d** \[ 2 + 6 + 10 + 14 \]

**e** \[ 1 + 1 + 1 + 1 + \ldots \]

**f** \[ 3 + 1 + \frac{1}{3} + \frac{1}{9} + \ldots \]

**g** \[ 0.4 + 0.8 + 1.2 + 1.6 + \ldots \]

**h** \[ 9 + 8.1 + 7.29 + 6.561 + \ldots \]

**i** \[ 1 + r + r^2 + r^3 + \ldots \]

**j** \[ 1 - 2x + 4x^2 - 8x^3 + \ldots \]
2 Find the common ratio of a geometric series with a first term of 10 and a sum to infinity of 30.

3 Find the common ratio of a geometric series with a first term of −5 and a sum to infinity of −3.

4 Find the first term of a geometric series with a common ratio of \(\frac{3}{2}\) and a sum to infinity of 60.

5 Find the first term of a geometric series with a common ratio of \(-\frac{1}{3}\) and a sum to infinity of 10.

6 Find the fraction equal to the recurring decimal 0.232 323 323 3.

7 Find \(\sum_{r=1}^{\infty} 4(0.5)^r\).

8 A ball is dropped from a height of 10 m. It bounces to a height of 6 m, then 3.6, and so on following a geometric sequence. Find the total distance travelled by the ball.

9 The sum to three terms of geometric series is 9 and its sum to infinity is 8. What could you deduce about the common ratio? Why? Find the first term and common ratio.

10 The sum to infinity of a geometric series is three times the sum to 2 terms. Find all possible values of the common ratio.

**Mixed Exercise 5I**

1 Find a rule that describes the following sequences:
   a 5, 11, 17, 23, ...
   b 3, 6, 9, 12, ...
   c 1, 3, 9, 27, ...
   d 10, 5, 0, -5, ...
   e 1, 4, 9, 16, ...
   f 1, 1.2, 1.44, 1.728, ...
   
   Which of the above are arithmetic sequences?
   For the ones that are, state the values of \(a\) and \(d\).

2 For the arithmetic series 5 + 9 + 13 + 17 + ...
   Find a the 20th term, and b the sum of the first 20 terms.

3 Find the least value of \(n\) for which \(\sum_{r=1}^{n} (4r - 3) > 2000\).

4 A salesman is paid commission of £10 per week for each life insurance policy that he has sold. Each week he sells one new policy so that he is paid £10 commission in the first week, £20 commission in the second week, £30 commission in the third week and so on.
   a Find his total commission in the first year of 52 weeks.
   b In the second year the commission increases to £11 per week on new policies sold, although it remains at £10 per week for policies sold in the first year. He continues to sell one policy per week. Show that he is paid £542 in the second week of his second year.
   c Find the total commission paid to him in the second year.
5 The sum of the first two terms of an arithmetic series is 47. The thirtieth term of this series is -62. Find:
   a the first term of the series and the common difference
   b the sum of the first 60 terms of the series.

6 a Find the sum of the integers which are divisible by 3 and lie between 1 and 400.
   b Hence, or otherwise, find the sum of the integers, from 1 to 400 inclusive, which are not divisible by 3.

7 A polygon has 10 sides. The lengths of the sides, starting with the smallest, form an arithmetic series. The perimeter of the polygon is 675 cm and the length of the longest side is twice that of the shortest side. Find, for this series:
   a the common difference
   b the first term.

8 The fifth term of an arithmetic series is 14 and the sum of the first three terms of the series is -3.
   a Use algebra to show that the first term of the series is -6 and calculate the common difference of the series.
   b Given that the n-th term of the series is greater than 282, find the least possible value of n.

9 The fourth term of an arithmetic series is 3k, where k is a constant, and the sum of the first six terms of the series is 7k + 9.
   a Show that the first term of the series is 9 - 8k.
   b Find an expression for the common difference of the series in terms of k.
   Given that the seventh term of the series is 12, calculate:
   c the value of k
   d the sum of the first 20 terms of the series.

10 State which of the following series are geometric. For the ones that are, give the value of the common ratio r.
   a \[4 + 7 + 10 + 13 + 16 + \ldots\]
   b \[4 + 6 + 9 + 13.5 + \ldots\]
   c \[20 + 10 + 5 + 2.5 + \ldots\]
   d \[4 - 8 + 16 - 32 + \ldots\]
   e \[4 - 2 - 8 - 14 - \ldots\]
   f \[1 + 1 + 1 + 1 + \ldots\]

11 Find the 8th and n-th terms of the following geometric sequences:
   a 10, 7.4, 9, ...
   b 5, 10, 20, ...
   c 4, -4, 4, ...
   d 3, -1.5, 0.75, ...

12 Find the sum to 10 terms of the following geometric series:
   a \[4 + 8 + 16 + \ldots\]
   b \[30 - 15 + 7.5 + \ldots\]
   c \[5 + 5 + 5 + \ldots\]
   d \[2 + 0.8 + 0.32 + \ldots\]

13 Determine which of the following geometric series converge. For the ones that do, give the limiting value of this sum (i.e. \(S_n\)).
   a \[6 + 2 + -2 + -3 + - \ldots\]
   b \[4 - 2 + 1 - \ldots\]
   c \[5 + 10 + 20 + \ldots\]
   d \[4 + 1 + 0.25 + \ldots\]

14 A geometric series has third term 27 and sixth term 8.
   a Show that the common ratio of the series is \(\frac{2}{3}\).
   b Find the first term of the series.
15 The second term of a geometric series is 80 and the fifth term of the series is 5.12:
   a Show that the common ratio of the series is 0.4.
   b Calculate:
      i the first term of the series,
      ii the sum to infinity of the series, giving your answer as an exact fraction.
   c the difference between the sum to infinity of the series and the sum of the first
      four terms of the series, giving your answer in the form \( a \times 10^n \), where
      \( 1 \leq a < 10 \) and \( n \) is an integer.

16 The \( n \)th term of a sequence is \( u_n \), where \( u_n = 95 \left( \frac{4}{5} \right)^n \), \( n = 1, 2, 3, \ldots \).
   a Find the value of \( u_1 \) and \( u_2 \).
   b Giving your answers to 3 significant figures, calculate:
      i the value of \( u_{21} \),
      ii \( \sum_{n=1}^{15} u_n \).
   c Find the sum to infinity of the series whose first term is \( u_1 \) and whose \( n \)th term is \( u_n \).

17 A sequence of numbers \( u_1, u_2, \ldots, u_n \) is given by the formula \( u_n = 3 \left( \frac{2}{3} \right)^n - 1 \)
   where \( n \) is a positive integer.
   a Find the values of \( u_1, u_2 \) and \( u_3 \).
   b Show that \( \sum_{n=1}^{15} u_n = -9.014 \) to 4 significant figures.
   c Prove that \( u_{n+1} = 2 \left( \frac{2}{3} \right)^n - 1 \).

18 The third and fourth terms of a geometric series are 6.4 and 5.12 respectively. Find:
   a the common ratio of the series,
   b the first term of the series,
   c the sum to infinity of the series.
   d Calculate the difference between the sum to infinity of the series and the sum of
      the first 25 terms of the series.

19 The first three terms of a geometric series are \( p(3q + 1) \), \( p(2q + 2) \) and \( p(2q - 1) \)
   respectively, where \( p \) and \( q \) are non-zero constants.
   a Use algebra to show that one possible value of \( q \) is 5 and to find the other possible
      value of \( q \).
   b For each possible value of \( q \), calculate the value of the common ratio of the series.
   Given that \( q = 5 \) and that the sum to infinity of the geometric series is 896, calculate:
   c the value of \( p \),
   d the sum, to 2 decimal places, of the first twelve terms of the series.

20 A savings scheme pays 5% per annum compound interest. A deposit of £100 is invested
   in this scheme at the start of each year.
   a Show that at the start of the third year, after the annual deposit has been made, the
      amount in the scheme is £315.25.
   b Find the amount in the scheme at the start of the fortieth year, after the annual
      deposit has been made.
1. You can use $\Sigma$ to signify 'sum of'. You can use $\Sigma$ to write series in a more concise way.
   \[ \sum_{r=1}^{10} (5 + 2r) = 7 + 9 + \ldots + 25 \]

2. All arithmetic series can be put in the form
   \[ a + (a + d) + (a + 2d) + (a + 3d) + (a + 4d) + (a + 5d) \]
   
   1st term 2nd term 3rd term 4th term 5th term 6th term

3. The $n$th term of an arithmetic series is $a + (n - 1)d$, where $a$ is the first term and $d$ is the common difference.

4. The formula for the sum of an arithmetic series is
   \[ S_n = \frac{n}{2}[2a + (n - 1)d] \]
   
   or \[ S_n = \frac{n}{2}(a + L) \]

   where $a$ is the first term, $d$ is the common difference, $n$ is the number of terms and $L$ is the last term in the series.

5. In a geometric series you get from one term to the next by multiplying by a constant called the common ratio.

6. The formula for the $n$th term is $ar^{n-1}$ where $a$ = first term and $r$ = common ratio.

7. The formula for the sum to $n$ terms is
   \[ S_n = \frac{a(1 - r^n)}{1 - r} \text{ or } S_n = \frac{a(r^n - 1)}{r - 1} \]

8. The sum to infinity exists if $|r| < 1$ and is $S_\infty = \frac{a}{1 - r}$.
6.1 You need to be able to expand \((1 + ax)^n\) using the binomial expansion.

\[
(1 + x)^n = \binom{n}{0}1^n + \binom{n}{1}1^{n-1}x^1 + \binom{n}{2}1^{n-2}x^2 + \binom{n}{3}1^{n-3}x^3 + \binom{n}{4}1^{n-4}x^4 + \ldots + \binom{n}{r}1^{n-r}x^r
\]

\[
= 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \frac{n(n-1)(n-2)(n-3)}{4!}x^4 + \ldots
\]

When \(n\) is a positive integer the coefficient \(\binom{n}{r}\) is sometimes written as \(^nC_r\) and this can be evaluated on most calculators.

**Example 1**

Find the first 3 terms in the binomial expansion of \((1 - \frac{1}{2}x)^6\) in ascending powers of \(x\).

\[
(1 - \frac{1}{2}x)^6 = 1 + 6(-\frac{1}{2}x) + 15\left(-\frac{1}{2}x\right)^2 + \ldots
\]

Use the expansion for \((1 + y)^n\) with \(y = -\frac{1}{2}x\)

\[
= 1 + 6\left(-\frac{1}{2}x\right) + 15\left(-\frac{1}{2}x\right)^2 \ldots
\]

Note the brackets

\[
\binom{6}{2} = \frac{6!}{4!2!} = 15
\]

You should check that you can evaluate this as \(6\binom{2}{2}\) on your calculator.

Simplify the terms. The brackets mean that the 3rd term is positive since "-" is squared.

**Example 2**

Find the first four terms in the binomial expansion of \((1 + 2x)^5\):

\[
(1 + 2x)^5 = 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \ldots
\]

Compare \((1 + x)^n\) with \((1 + 2x)^n\),

\[
= 1 + 5(2x) + \frac{5(4)}{2!}(2x)^2 + \frac{5(4)(3)}{3!}(2x)^3 + \ldots
\]

Replace \(n\) by 5 and '\(x\)' by 2x.

\[
= 1 + 10x + 40x^2 + 80x^3 + \ldots
\]

**Example 3**

Find the coefficient of \(a\) \(x^3\) and \(b\) \(x^8\) in the binomial expansion of \((1 - 2x)^{12}\).

\(a\) \((1 - 2x)^{12} = \ldots + \binom{12}{3}(-2x)^3 + \ldots\)

Coefficient of \(x^3\) = \(220 \times (-2)^3 = -1760\)

You do not need the whole expansion just the required terms.

\[\text{NB} \left(\binom{12}{3}\right) = 12C_3 = \frac{12!}{9!3!} = 220\]

\(b\) \((1 - 2x)^{12} = \ldots + \binom{12}{8}(-2x)^8 + \ldots\)

Coefficient of \(x^8\) = \(495 \times (-2)^8 = 126720\)

\[\text{NB} \left(\binom{12}{8}\right) = 12C_8 = \frac{12!}{4!8!} = 495\]
Exercise 6A

Use the binomial expansion to find the first four terms of
1 \((1 + x)^8\)
2 \((1 - 2x)^6\)
3 \(\left(1 + \frac{x}{2}\right)^{10}\)
4 \((1 - 3x)^5\)

5 When \((1 - 2x)^p\) is expanded, the coefficient of \(x^2\) is 40. Given that \(p > 0\), use this information to find:
   a The value of the constant \(p\).
   b The coefficient of \(x\).
   c The coefficient of \(x^3\).

6 Write down the first four terms in the expansion of \(\left(1 - \frac{x}{10}\right)^6\).
   By substituting an appropriate value for \(x\), find an approximate value to \((0.99)^6\). Use your calculator to find the degree of accuracy of your approximation.

7 Find the term in \(x^3\) of the following expansions:
   a \((1 - x)^6\)
   b \((1 + x)^{10}\)
   c \((1 + x)^{20}\)

8 a Expand \((3 + 2x)^4\) in ascending powers of \(x\), giving each coefficient as an integer.
   b Hence, or otherwise, write down the expansion of \((3 - 2x)^4\) in ascending powers of \(x\).
   c Hence by choosing a suitable value for \(x\) show that \((3 + 2\sqrt{2})^4 + (3 - 2\sqrt{2})^4\) is an integer and state its value.

6.2 You can use the binomial expansion \((1 + x)^n = 1 + nx + \frac{n(n - 1)}{2!}x^2 + \frac{n(n - 1)(n - 2)}{3!}x^3 + \ldots\) when \(n\) is not a positive integer.

When \(n\) is not a positive integer then none of the \((n - r)\) terms in the coefficients will be equal to zero and so the series will be infinite. In this case the expansion of \((1 + x)^n\) will only be valid for values of \(x\) in the range \(-1 < x < 1\). This is sometimes written using the modulus function as \(|x| < 1\).

Example 4

Use the binomial expansion to find the first four terms of
a \(\frac{1}{1 + x}\)
   Write in index form.
   Replace \(n\) by \(-1\) in the expansion.
   \[1 + (-1)(x) + \frac{(-1)(-2)(x)^2}{2!} + \frac{(-1)(-2)(-3)(x)^3}{3!} + \ldots\]
   \[= 1 - x + x^2 - 1x^3 + \ldots\]
   As \(n\) is not a positive integer, no coefficient will ever be equal to zero.
   The expansion is infinite, and convergent when \(|x| < 1\).

b \(\sqrt{1 - 3x}\)
\( \sqrt{1 - 3x} = (1 - 3x)^{\frac{1}{2}} \)

\[
= 1 + \left(\frac{1}{2}\right)(-3x) + \frac{\left(\frac{1}{2}\right)(\frac{1}{2} - 1)(-3x)^2}{2!} + \frac{\left(\frac{1}{2}\right)(\frac{1}{2} - 1)(\frac{1}{2} - 2)(-3x)^3}{3!} + \ldots \\
= 1 - \frac{3x}{2} + \frac{\left(\frac{1}{2}\right)(-\frac{3}{2})9x^2}{2} + \frac{\left(\frac{1}{2}\right)(-\frac{3}{2})(-\frac{5}{2})(-27x^3)}{6} + \ldots \\
= 1 - \frac{3x}{2} - \frac{9x^2}{8} - \frac{27x^3}{16} + \ldots 
\]

Write in index form.
Replace \( n \) by \( \frac{1}{2} \) and \( x \) by \(-3x\).

Be careful to write this as \((-3x)^2\), not \(-3x^2\).

Simplify terms.
Because \( n \) is not a positive integer, no coefficient will ever be equal to zero.
The expansion is **infinite**.
and convergent when \(|x| < \frac{1}{3}\) because \(|3x| < 1\)

**Example 5**

Find the binomial expansions of

a \( (1 - x)^{\frac{1}{3}} \)

b \( \frac{1}{(1 + 4x)^2} \), up to and including the term in \( x^3 \).

State the range of values of \( x \) for which the expansions are valid.

a \( (1 - x)^{\frac{1}{3}} \)

\[
= 1 + \left(\frac{1}{3}\right)(2x) + \frac{\left(\frac{1}{3}\right)(\frac{1}{3} - 1)(-x)^2}{2!} + \frac{\left(\frac{1}{3}\right)(\frac{1}{3} - 1)(\frac{1}{3} - 2)(-x)^3}{3!} + \ldots \\
= 1 + \frac{2x}{3} + \frac{\left(\frac{1}{3}\right)(-\frac{2}{3})(-x)^2}{2} + \frac{\left(\frac{1}{3}\right)(-\frac{2}{3})(-\frac{5}{3})(-x)^3}{6} + \ldots \\
= 1 - \frac{2x}{3} - \frac{x^2}{9} - \frac{5x^3}{81} + \ldots 
\]

Expansion is valid as long as \(|-x| < 1 \Rightarrow |x| < 1\)

b \( \frac{1}{(1 + 4x)^2} \)

\[
= (1 + 4x)^{-2} \\
= 1 + (-2)(4x) + \frac{(-2)(-2 - 1)(4x)^2}{2!} + \frac{(-2)(-2 - 1)(-2 - 2)(4x)^3}{3!} + \ldots 
\]

Write in index form.
Replace \( n \) by \(-2\), \( x \) by \(4x\).

Simplify brackets.
\[ = 1 + (-2)(4x) + \frac{(-2)(-3)16x^2}{2} + \frac{(-2)(-3)(-4)64x^3}{6} + \ldots \]
Simplify coefficients. 

\[ = 1 - 8x + 48x^2 - 256x^3 + \ldots \]
Terms in expansion are \((4x), (4x)^2, (4x)^3\). 
Expansion is valid as long as \(|4x| < 1\)

\[ \Rightarrow |x| < \frac{1}{4}. \]

**Example 6**

Find the expansion of \(\sqrt{1 - 2x}\) up to and including the term in \(x^3\). By substituting in \(x = 0.01\), find a suitable decimal approximation to \(\sqrt{2}\).

\[ \sqrt{1 - 2x} = (1 - 2x)^{\frac{1}{2}} \]
Write in index form.

\[ = 1 + \left(\frac{1}{2}\right)(-2x) + \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)(-2x^2)}{2!} + \ldots \]
Replace \(n\) by \(\frac{1}{2}\), \(x\) by \((-2x)\).

\[ = 1 + \left(\frac{1}{2}\right)(-2x) + \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)(-2x^2)}{2} + \ldots \]
Simplify brackets.

\[ = 1 - x - \frac{x^2}{2} - \frac{x^3}{2} + \ldots \]
Terms in expansion are \((-2x), (-2x)^2, (-2x)^3\).
Expansion is valid as long as \(|2x| < 1\)

\[ \Rightarrow |x| < \frac{1}{2}. \]

\[ \sqrt{(1 - 2 \times 0.01)} \approx 1 - 0.01 - \frac{(0.01)^2}{2} - \frac{(0.01)^3}{2} \]
Substitute \(x = 0.01\) into both sides of expansion. This is valid as \(|x| < \frac{1}{2}\).

\[ \sqrt{0.98} \approx 1 - 0.01 - 0.000005 - 0.00000005 \]
Simplify both sides. Note that the terms are getting smaller.

\[ \sqrt{\frac{98}{100}} = 0.9899495 \]
Write \(0.98\) as \(\frac{98}{100}\).

\[ \sqrt{\frac{49 \times 2}{100}} = 0.9899495 \]
Use rules of surds.

\[ \frac{7}{10} \approx 0.9899495 \times 10 \]

\[ \sqrt{2} \approx \frac{0.9899495 \times 10}{7} \]

\[ \sqrt{2} \approx 1.414213571 \]
Exercise 6B

1. Find the binomial expansion of the following up to and including the terms in \(x^3\). State the range values of \(x\) for which these expansions are valid.
   
   \[
   \begin{align*}
   \text{a} & \quad (1 + 2x)^3 \\
   \text{b} & \quad \frac{1}{1 - x} \\
   \text{c} & \quad \sqrt{1 + x} \\
   \text{d} & \quad \frac{1}{(1 + 2x)^3} \\
   \text{e} & \quad \sqrt{(1 - 3x)} \\
   \text{f} & \quad (1 - 10x)^{\frac{3}{2}} \\
   \text{g} & \quad \left(1 + \frac{x}{4}\right)^{-4} \\
   \text{h} & \quad \frac{1}{(1 + 2x^2)}
   \end{align*}
   \]

2. By first writing \(\frac{(1 + x)}{(1 - 2x)}\) as \((1 + x)(1 - 2x)^{-1}\) show that the cubic approximation to \(\frac{(1 + x)}{(1 - 2x)}\) is \(1 + 3x + 6x^2 + 12x^3\). State the range of values of \(x\) for which this expansion is valid.

3. Find the binomial expansion of \(\sqrt{1 + 3x}\) in ascending powers of \(x\) up to and including the term in \(x^3\). By substituting \(x = 0.01\) in the expansion, find an approximation to \(\sqrt{1.03}\). By comparing it with the exact value, comment on the accuracy of your approximation.

4. In the expansion of \((1 + ax)^{\frac{1}{2}}\) the coefficient of \(x^2\) is 24. Find possible values of the constant \(a\) and the corresponding term in \(x^3\).

5. Show that if \(x\) is small, the expression \(\frac{1 + x}{1 - x}\) is approximated by \(1 + x + \frac{1}{2}x^2\).

6. Find the first four terms in the expansion of \((1 - 3x)^3\). By substituting in a suitable value of \(x\), find an approximation to 9.78.

Mixed Exercise 6C

1. When \((1 - \frac{3}{2}x)^p\) is expanded in ascending powers of \(x\), the coefficient of \(x\) is \(-24\).
   
   a. Find the value of \(p\).
   
   b. Find the coefficient of \(x^3\) in the expansion.
   
   c. Find the coefficient of \(x^3\) in the expansion.

2. a. Expand \((1 - 2x)^{10}\) in ascending powers of \(x\) up to and including the term in \(x^3\), simplifying each coefficient in the expansion.
   
   b. Use your expansion to find an approximation to \((0.98)^{10}\), stating clearly the substitution which you have used for \(x\).

3. The coefficient of \(x^2\) in the binomial expansion of \(\left(1 + \frac{3}{2}x\right)^n\), where \(n\) is a positive integer, is 7.
   
   a. Find the value of \(n\).
   
   b. Using the value of \(n\) found in part a, find the coefficient of \(x^4\).

4. a. Expand \((1 + 2x)^{12}\) in ascending powers of \(x\) up to and including the term in \(x^3\), simplifying each coefficient.
   
   b. By substituting a suitable value for \(x\), which must be stated, into your answer to part a, calculate an approximate value of \((1.02)^{12}\).
   
   c. Use your calculator, writing down all the digits in your display, to find a more exact value of \((1.02)^{12}\).
   
   d. Calculate, to 3 significant figures, the percentage error of the approximation found in part b.
5 Find binomial expansions of the following in ascending powers of \( x \) as far as the term in \( x^3 \). State the set of values of \( x \) for which the expansion is valid.

\[
\begin{align*}
  a & \quad (1 - 4x)^3 \\
  b & \quad \frac{1}{(1 - 2x)} \\
  c & \quad \frac{1 + x}{1 + 3x}
\end{align*}
\]

6 Find the first four terms of the expansion in ascending powers of \( x \) of:

\( (1 - \frac{1}{2}x)^\frac{1}{2}, \ |x| < 2 \)

and simplify each coefficient.

7 Obtain the first four non-zero terms in the expansion, in ascending powers of \( x \), of the function \( f(x) \) where \( f(x) = \frac{1}{\sqrt{1 + 3x^2}}, \ 3x^2 < 1 \).

8 Give the binomial expansion of \( (1 + x)^3 \) up to and including the term in \( x^3 \). By substituting \( x = \frac{1}{4} \), find the fraction that is an approximation to \( \sqrt{5} \).

9 When \( (1 + ax)^n \) is expanded as a series in ascending powers of \( x \), the coefficients of \( x \) and \( x^2 \) are \(-6\) and \(27\) respectively.

\[
\begin{align*}
  a & \quad \text{Find the values of } a \text{ and } n. \\
  b & \quad \text{Find the coefficient of } x^3. \\
  c & \quad \text{State the values of } x \text{ for which the expansion is valid.}
\end{align*}
\]
Chapter 6: Summary

1. The binomial expansion \((1 + x)^n = 1 + nx + \frac{n(n-1)x^2}{2!} + \frac{n(n-1)(n-2)x^3}{3!} + \ldots\) can be used to give an exact expression if \(n\) is a positive integer, or an approximate expression for any other rational number.

   - \((1 + 2x)^3 = 1 + 3(2x) + 3 \times 2 \times 2 \times \frac{(2x)^2}{2!} + 3 \times 2 \times 1 \times \frac{(2x)^3}{3!} + 3 \times 2 \times 1 \times 0 \times \frac{(2x)^4}{4!} + \ldots\)  
     
   - \(= 1 + 6x + 12x^2 + 8x^3\) (Expansion is finite and exact.)

   - \(\sqrt{(1 - x)} = (1 - x)^{\frac{1}{2}} = 1 + \left(\frac{1}{2}\right)(-x) + \frac{1}{2}\left(\frac{-1}{2}\right)^2(-x)^2 + \frac{1}{2}\left(\frac{-1}{2}\right)\left(\frac{-3}{2}\right)(-x)^3 + \ldots\)
     
   - \(= 1 - \frac{1}{2}x - \frac{1}{8}x^2 - \frac{1}{16}x^3 + \ldots\) (Expansion is infinite and approximate.)

2. The expansion \((1 + x)^n = 1 + nx + n(n-1)\frac{x^2}{2!} + n(n-1)(n-2)\frac{x^3}{3!} + \ldots\), where \(n\) is negative or a fraction, is only valid if \(|x| < 1\).
Chapter 7: Scalar and vector quantities

7.1 You need to know the difference between a scalar and a vector, and how to write down vectors and draw vector diagrams.

A scalar quantity can be described by using a single number (the magnitude or size).

- A vector quantity has both magnitude and direction.

For example:

Scalar: The distance from $P$ to $Q$ is 100 metres.
Vector: From $P$ to $Q$ you go 100 metres north.

Distance is a scalar.
This is called the displacement from $P$ to $Q$. Displacement is a vector.

Scalar: A ship is sailing at 12 km h$^{-1}$.
Vector: A ship is sailing at 12 km h$^{-1}$, on a bearing of 060°.

Speed is a scalar.
This is called the velocity of the ship. Velocity is a vector.

Example 1
Show on a diagram the displacement vector from $P$ to $Q$, where $Q$ is 500 m due north of $P$.

This is called a ‘directed line segment’.
The direction of the arrow shows the direction of the vector.
The vector is written as $\vec{PQ}$.
The length of the line segment $PQ$ represents distance 500 m. In accurate diagrams a scale could be used (e.g. 1 cm represents 100 m).

Sometimes, instead of using the endpoints $P$ and $Q$, a small (lower case) letter is used.
In print, the small letter will be in bold type. In writing, you should underline the small letter to show it is a vector:

$\mathbf{a}$ or $\underline{a}$
- Vectors that are equal have both the same magnitude and the same direction.

Here $\overrightarrow{PQ} = \overrightarrow{RS}$.

- Two vectors are added using the 'triangle law'.

**Hint:**
Think of displacement vectors.
If you travel from $P$ to $Q$, then from $Q$ to $R$, the resultant journey is $P$ to $R$:

$$\overrightarrow{PQ} + \overrightarrow{QR} = \overrightarrow{PR}$$

When you add the vectors $\mathbf{a}$ and $\mathbf{b}$, the resultant vector $\mathbf{a} + \mathbf{b}$ goes from 'the start of $\mathbf{a}$ to the finish of $\mathbf{b}$'.

This is sometimes called the triangle law for vector addition.

**Example 2**
The diagram shows the vectors $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$. Draw another diagram to illustrate the vector addition $\mathbf{a} + \mathbf{b} + \mathbf{c}$.

First use the triangle law for $\mathbf{a} + \mathbf{b}$, then use it again for $(\mathbf{a} + \mathbf{b}) + \mathbf{c}$.

The resultant goes from the start of $\mathbf{a}$ to the finish of $\mathbf{c}$. 
- Adding the vectors \( \overrightarrow{PQ} \) and \( \overrightarrow{QP} \) gives the zero vector \( 0 \). \( \overrightarrow{PQ} + \overrightarrow{QP} = 0 \)

**Hint:**
If you travel from \( P \) to \( Q \), then back from \( Q \) to \( P \), you are back where you started, so your displacement is zero.

The zero displacement vector is \( \mathbf{0} \).
It is printed in bold type, or underlined in written work.
You can also write \( \overrightarrow{QP} \) as \( -\overrightarrow{QP} \).
So \( \overrightarrow{PQ} + \overrightarrow{QP} = 0 \) or \( -\overrightarrow{QP} - \overrightarrow{PQ} = 0 \).

- The modulus of a vector is another name for its magnitude.
  - The modulus of the vector \( \mathbf{a} \) is written as \( |\mathbf{a}| \).
  - The modulus of the vector \( \overrightarrow{PQ} \) is written as \( |\overrightarrow{PQ}| \).

**Example 3**
The vector \( \mathbf{a} \) is directed due east and \( |\mathbf{a}| = 12 \). The vector \( \mathbf{b} \) is directed due south and \( |\mathbf{b}| = 5 \). Find \( |\mathbf{a} + \mathbf{b}| \).

\[
|\mathbf{a} + \mathbf{b}|^2 = 12^2 + 5^2 = 169
\]
\[
|\mathbf{a} + \mathbf{b}| = 13
\]

**Example 4**
In the diagram, \( \overrightarrow{QP} = \mathbf{a} \), \( \overrightarrow{QR} = \mathbf{b} \), \( \overrightarrow{QS} = \mathbf{c} \) and \( \overrightarrow{RT} = \mathbf{d} \).
Find in terms of \( \mathbf{a} \), \( \mathbf{b} \), \( \mathbf{c} \) and \( \mathbf{d} \):

\[
\begin{align*}
\mathbf{a} & \quad \overrightarrow{PS} = \overrightarrow{PQ} + \overrightarrow{QS} = -\mathbf{a} + \mathbf{c} = \mathbf{c} - \mathbf{a} \\
\mathbf{b} & \quad \overrightarrow{RP} = \overrightarrow{RQ} + \overrightarrow{QP} = -\mathbf{b} + \mathbf{a} = \mathbf{a} - \mathbf{b} \\
\mathbf{c} & \quad \overrightarrow{PT} = \overrightarrow{PR} + \overrightarrow{RT} = (\mathbf{b} - \mathbf{a}) + \mathbf{d} = \mathbf{b} + \mathbf{d} - \mathbf{a} \\
\mathbf{d} & \quad \overrightarrow{TS} = \overrightarrow{TR} + \overrightarrow{RS} = -\mathbf{d} + (\overrightarrow{RQ} + \overrightarrow{QS}) = -\mathbf{d} + (-\mathbf{b} + \mathbf{c}) = \mathbf{c} - \mathbf{b} - \mathbf{d}
\end{align*}
\]
Add vectors using \( \triangle PQS \).
Add vectors using \( \triangle RQP \).
Add vectors using \( \triangle PRT \).
Use \( \overrightarrow{PR} = -\overrightarrow{QP} = -(\mathbf{a} - \mathbf{b}) = \mathbf{b} - \mathbf{a} \).
Add vectors using \( \triangle TRS \) and also \( \triangle RQS \).
Exercise 7A

1. The diagram shows the vectors $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ and $\mathbf{d}$. Draw a diagram to illustrate the vector addition $\mathbf{a} + \mathbf{b} + \mathbf{c} + \mathbf{d}$.

2. The vector $\mathbf{a}$ is directed due north and $|\mathbf{a}| = 24$. The vector $\mathbf{b}$ is directed due west and $|\mathbf{b}| = 7$. Find $|\mathbf{a} + \mathbf{b}|$.

3. The vector $\mathbf{a}$ is directed north-east and $|\mathbf{a}| = 20$. The vector $\mathbf{b}$ is directed south-east and $|\mathbf{b}| = 13$. Find $|\mathbf{a} + \mathbf{b}|$.

4. In the diagram, $PQ = \mathbf{a}$, $QS = \mathbf{b}$, $SR = \mathbf{c}$ and $PT = \mathbf{d}$. Find in terms of $\mathbf{a}$, $\mathbf{b}$, $\mathbf{c}$ and $\mathbf{d}$:
   
   a. $\overrightarrow{OQ}$
   b. $\overrightarrow{PR}$
   c. $\overrightarrow{TS}$
   d. $\overrightarrow{TR}$

5. In the diagram, $\overrightarrow{WX} = \mathbf{a}$, $\overrightarrow{WY} = \mathbf{b}$ and $\overrightarrow{WZ} = \mathbf{c}$. It is given that $\overrightarrow{XY} = \overrightarrow{ZY}$. Prove that $\mathbf{a} + \mathbf{c} = 2\mathbf{b}$.
   
   (2\mathbf{b} is equivalent to $\mathbf{b} + \mathbf{b}$).

7.2 You need to be able to perform simple vector arithmetic, and to know the definition of a unit vector.

Example 5

The diagram shows the vector $\mathbf{a}$. Draw diagrams to illustrate the vectors $3\mathbf{a}$ and $-2\mathbf{a}$.

Vector $3\mathbf{a}$ is $\mathbf{a} + \mathbf{a} + \mathbf{a}$, so is in the same direction as $\mathbf{a}$ with 3 times its magnitude. The vector $\mathbf{a}$ has been multiplied by the scalar 3 (a scalar multiple).

Vector $-2\mathbf{a}$ is $-\mathbf{a} + \mathbf{a}$, so is in the opposite direction to $\mathbf{a}$ with 2 times its magnitude.
• Any vector parallel to the vector \( \mathbf{a} \) may be written as \( \lambda \mathbf{a} \), where \( \lambda \) is a non-zero scalar.

**Example 6**
Show that the vectors \( 6\mathbf{a} + 8\mathbf{b} \) and \( 9\mathbf{a} + 12\mathbf{b} \) are parallel.

\[
9\mathbf{a} + 12\mathbf{b} = \frac{3}{2}(6\mathbf{a} + 8\mathbf{b})
\]
Here \( \lambda = \frac{3}{2} \).

\[\therefore \text{ the vectors are parallel.}\]

• Subtracting a vector is equivalent to ‘adding a negative vector’, so \( \mathbf{a} - \mathbf{b} \) is defined to be \( \mathbf{a} + (\mathbf{-b}) \).

![Diagram](image)

*Hint:*
To subtract \( \mathbf{b} \), you reverse the direction of \( \mathbf{b} \) then add.

• A unit vector is a vector which has magnitude (or modulus) 1 unit.

**Example 7**
The vector \( \mathbf{a} \) has magnitude 20 units. Write down a unit vector that is parallel to \( \mathbf{a} \).

The unit vector is \( \frac{\mathbf{a}}{20} \) or \( \frac{1}{20} \mathbf{a} \). Divide \( \mathbf{a} \) by the magnitude. In general, the unit vector is \( \frac{\mathbf{a}}{|\mathbf{a}|} \).

• If \( \lambda \mathbf{a} + \mu \mathbf{b} = \alpha \mathbf{a} + \beta \mathbf{b} \), and the non-zero vectors \( \mathbf{a} \) and \( \mathbf{b} \) are not parallel, then \( \lambda = \alpha \) and \( \mu = \beta \).

The above result can be shown as follows:
\( \lambda \mathbf{a} + \mu \mathbf{b} = \alpha \mathbf{a} + \beta \mathbf{b} \) can be written as \( (\lambda - \alpha)\mathbf{a} = (\beta - \mu)\mathbf{b} \), but two vectors cannot be equal unless they are parallel or zero.
Since \( \mathbf{a} \) and \( \mathbf{b} \) are not parallel or zero, \( (\lambda - \alpha) = 0 \) and \( (\beta - \mu) = 0 \), so \( \lambda = \alpha \) and \( \beta = \mu \).

**Example 8**
Given that \( 5\mathbf{a} - 4\mathbf{b} = (2s + t)\mathbf{a} + (s - t)\mathbf{b} \), where \( \mathbf{a} \) and \( \mathbf{b} \) are non-zero, non-parallel vectors, find the values of the scalars \( s \) and \( t \).

\[
2s + t = 5 \\
s - t = -4
\]
Equate the \( \mathbf{a} \) and \( \mathbf{b} \) coefficients.

\[
3s = 1
\]
Solve simultaneously (add).

\[
s = \frac{1}{3}
\]

\[
t = 5 - 2s = 4\frac{1}{3}
\]
So \( s = \frac{1}{3} \) and \( t = 4\frac{1}{3} \).
Example 9

In the diagram, $\overrightarrow{PQ} = 3a$, $\overrightarrow{QR} = b$, $\overrightarrow{SR} = 4a$ and $\overrightarrow{PX} = k\overrightarrow{PR}$.

Find, in terms of $a$, $b$ and $k$:

- $a \quad \overrightarrow{PS}$  
- $b \quad \overrightarrow{PX}$
- $c \quad \overrightarrow{SQ}$  
- $d \quad \overrightarrow{SX}$

Use the fact that $X$ lies on $SQ$ to find the value of $k$.

\[
\begin{align*}
\text{a} & \quad \overrightarrow{PS} = \overrightarrow{PR} + \overrightarrow{RS} = \overrightarrow{PQ} + \overrightarrow{QR} + \overrightarrow{RS} = 3a + b - 4a = b - a \\
\text{b} & \quad \overrightarrow{PR} = \overrightarrow{PQ} + \overrightarrow{QR} = 3a + b \\
\quad & \quad \overrightarrow{PX} = k\overrightarrow{PR} = k(3a + b) \\
\text{c} & \quad \overrightarrow{SQ} = 4a - b \\
\text{d} & \quad \overrightarrow{SX} = \overrightarrow{SP} + \overrightarrow{PX} = -(b - a) + k(3a + b) = -b + a + k(3a + b) = (3k + 1)a + (k - 1)b
\end{align*}
\]

$X$ lies on $SQ$, so $\overrightarrow{SQ}$ and $\overrightarrow{SX}$ are parallel.

\[
\begin{align*}
\text{So } (3k + 1)a + (k - 1)b & = \lambda(4a - b) \\
\text{and } (3k + 1) = 4\lambda - \lambda \\
k & = \frac{3}{7}
\end{align*}
\]

Use the fact that, for parallel vectors, one is a scalar multiple of the other.

Exercise 7B

1. In the triangle $PQR$, $PQ = 2a$ and $QR = 2b$. The mid-point of $PR$ is $M$.

   Find, in terms of $a$ and $b$:

   - $a \quad \overrightarrow{PR}$  
   - $b \quad \overrightarrow{PM}$
   - $c \quad \overrightarrow{QM}$

2. $ABCD$ is a trapezium with $AB$ parallel to $DC$ and $DC = 3AB$.

   $M$ is the mid-point of $DC$, $\overrightarrow{MA} = a$ and $\overrightarrow{BC} = b$.

   Find, in terms of $a$ and $b$:

   - $a \quad \overrightarrow{AM}$  
   - $b \quad \overrightarrow{BD}$
   - $c \quad \overrightarrow{MB}$  
   - $d \quad \overrightarrow{DA}$

3. In each part, find whether the given vector is parallel to $a - 3b$:

   - $a \quad 2a - 6b$  
   - $b \quad 4a - 12b$
   - $c \quad a + 3b$
   - $d \quad 3b - a$  
   - $e \quad 9b - 3a$
   - $f \quad \frac{1}{2}a - \frac{3}{2}b$
4 The non-zero vectors \( \mathbf{a} \) and \( \mathbf{b} \) are not parallel. In each part, find the value of \( \lambda \) and the value of \( \mu \):

- \( \mathbf{a} + 3\mathbf{b} = 2\lambda \mathbf{a} - \mu \mathbf{b} \)
- \( (\lambda + 2)\mathbf{a} + (\mu - 1)\mathbf{b} = 0 \)
- \( 4\lambda \mathbf{a} - 5\mathbf{b} - \mathbf{a} + \mu \mathbf{b} = 0 \)
- \((1 + \lambda)\mathbf{a} + 2\lambda \mathbf{b} = \mu \mathbf{a} + 4\mu \mathbf{b} \)
- \((3\lambda + 5)\mathbf{a} + \mathbf{b} = 2\mu \mathbf{a} + (\lambda - 3)\mathbf{b} \)

5 In the diagram, \( \overrightarrow{OA} = \mathbf{a}, \overrightarrow{OB} = \mathbf{b} \) and \( C \) divides \( AB \) in the ratio 5:1.

- Write down, in terms of \( \mathbf{a} \) and \( \mathbf{b} \), expressions for \( \overrightarrow{AC} \) and \( \overrightarrow{OC} \).

Given that \( \overrightarrow{OE} = \lambda \mathbf{b} \), where \( \lambda \) is a scalar:

- Write down, in terms of \( \mathbf{a} \) and \( \lambda \), an expression for \( \overrightarrow{OE} \).

Given that \( \overrightarrow{OD} = \mu (\mathbf{b} - \mathbf{a}) \), where \( \mu \) is a scalar:

- Write down, in terms of \( \mathbf{a}, \mathbf{b}, \lambda \) and \( \mu \), an expression for \( \overrightarrow{ED} \).

Given also that \( E \) is the mid-point of \( CD \):

- Deduce the values of \( \lambda \) and \( \mu \).

6 In the diagram \( \overrightarrow{OA} = \mathbf{a}, \overrightarrow{OB} = \mathbf{b}, \overrightarrow{OC} = 2\overrightarrow{OA} \) and \( 4\overrightarrow{OD} = 7\overrightarrow{OB} \).

The line \( DC \) meets the line \( AB \) at \( E \).

- Write down, in terms of \( \mathbf{a} \) and \( \mathbf{b} \), expressions for \( \overrightarrow{AB} \) and \( \overrightarrow{DC} \).

Given that \( \overrightarrow{DE} = \lambda \overrightarrow{DC} \) and \( \overrightarrow{EB} = \mu \overrightarrow{AB} \), where \( \lambda \) and \( \mu \) are constants:

- Use \( \triangle EBD \) to form an equation relating to \( \mathbf{a}, \mathbf{b}, \lambda \) and \( \mu \).

Hence:

- Show that \( \lambda = \frac{9}{11} \).
- Find the exact value of \( \mu \).
- Express \( \overrightarrow{OE} \) in terms of \( \mathbf{a} \) and \( \mathbf{b} \).

The line \( OE \) produced meets the line \( AD \) at \( F \).

Given that \( \overrightarrow{OF} = k \overrightarrow{OE} \), where \( k \) is a constant and that \( \overrightarrow{AF} = \frac{1}{10}(7\mathbf{b} - 4\mathbf{a}) \):

- Find the value of \( k \).

We sometimes say that \( OE, AB \) and \( CD \) are **concurrent** at the point \( E \).

7 In \( \triangle OAB \), \( P \) is the mid-point of \( AB \) and \( Q \) is the point on \( OP \) such that \( Q = \frac{1}{3}P \).

Given that \( \overrightarrow{OA} = \mathbf{a} \) and \( \overrightarrow{OB} = \mathbf{b} \), find, in terms of \( \mathbf{a} \) and \( \mathbf{b} \):

- \( \overrightarrow{AB} \)
- \( \overrightarrow{OP} \)
- \( \overrightarrow{OQ} \)
- \( \overrightarrow{AQ} \)

The point \( R \) on \( OB \) is such that \( OR = kOB \), where \( 0 < k < 1 \).

- Find, in terms of \( \mathbf{a}, \mathbf{b} \) and \( k \), the vector \( \overrightarrow{AR} \).

Given that \( AQR \) is a straight line:

- Find the ratio in which \( Q \) divides \( AR \) and the value of \( k \).
8 In the figure \(OE:EA = 1:2\), \(AF:FB = 3:1\) and
\(OG:OB = 3:1\). The vector \(\overrightarrow{OA} = a\) and the
vector \(\overrightarrow{OB} = b\).

Find, in terms of \(a\), \(b\) or \(a\) and \(b\), expressions for:

- **a** \(OE\)
- **b** \(OF\)
- **c** \(EF\)
- **d** \(BG\)
- **e** \(FB\)
- **f** \(FG\)

Use your results in **c** and **f** to show that the points
\(E, F\) and \(G\) are collinear and find the ratio \(EF:FG\).

**h** Find \(EB\) and \(AG\) and hence prove that \(EB\) is parallel to \(AG\).

7.3 You need to be able to use vectors to describe the position of a point in two or three dimensions.

- The position vector of a point \(A\) is the vector \(\overrightarrow{OA}\), where \(O\) is the origin. \(\overrightarrow{OA}\) is usually written as vector \(a\).

\[
\overrightarrow{OA} = a
\]

- \(\overrightarrow{AB} = b - a\), where \(a\) and \(b\) are the position vectors of \(A\) and \(B\) respectively.

**Hint:**
Use the triangle law to give
\[
\overrightarrow{AB} = \overrightarrow{AO} + \overrightarrow{OB} = -a + b
\]
So \(\overrightarrow{AB} = b - a\)

**Example 10**
In the diagram the points \(A\) and \(B\) have position vectors \(a\) and \(b\) respectively (referred to the origin \(O\)).
The point \(P\) divides \(AB\) in the ratio \(1:2\).

Find the position vector of \(P\).

\[
\overrightarrow{AB} = b - a
\]

\[
\overrightarrow{OP} = \overrightarrow{OA} + \overrightarrow{AP}
\]

\[
\overrightarrow{AP} = \frac{1}{3}(b - a)
\]

\[
\overrightarrow{OP} = a + \frac{1}{3}(b - a)
\]

\[
\overrightarrow{OP} = \frac{2}{3}a + \frac{1}{3}b
\]

You could write \(p = \frac{2}{3}a + \frac{1}{3}b\).
**Exercise 7C**

1. The points \( A \) and \( B \) have position vectors \( \mathbf{a} \) and \( \mathbf{b} \) respectively (referred to the origin \( O \)).
   The point \( P \) divides \( AB \) in the ratio \( 1:5 \).
   Find, in terms of \( \mathbf{a} \) and \( \mathbf{b} \), the position vector of \( P \).

2. The points \( A, B \) and \( C \) have position vectors \( \mathbf{a}, \mathbf{b} \) and \( \mathbf{c} \) respectively (referred to the origin \( O \)).
   The point \( P \) is the mid-point of \( AB \).
   Find, in terms of \( \mathbf{a}, \mathbf{b} \) and \( \mathbf{c} \), the vector \( \overrightarrow{PC} \).

3. \( OABCDE \) is a regular hexagon. The points \( A \) and \( B \) have position vectors \( \mathbf{a} \) and \( \mathbf{b} \) respectively, referred to the origin \( O \).
   Find, in terms of \( \mathbf{a} \) and \( \mathbf{b} \), the position vectors of \( C, D \) and \( E \).

**7.4 You need to know how to write down and use the Cartesian components of a vector in two dimensions.**

- The vectors \( \mathbf{i} \) and \( \mathbf{j} \) are unit vectors parallel to the \( x \)-axis and the \( y \)-axis, and in the direction of \( x \) increasing and \( y \) increasing, respectively.

**Example 11**

The points \( A \) and \( B \) in the diagram have coordinates \((3, 4)\) and \((11, 2)\) respectively.
Find, in terms of \( \mathbf{i} \) and \( \mathbf{j} \):
- \( \mathbf{a} \) the position vector of \( A \)
- \( \mathbf{b} \) the position vector of \( B \)
- \( \mathbf{c} \) the vector \( \overrightarrow{AB} \)

\[
\begin{align*}
\mathbf{a} &= \mathbf{OA} = 3\mathbf{i} + 4\mathbf{j} & \text{i goes 1 unit 'across', j goes 1 unit 'up'}; \\
\mathbf{b} &= \mathbf{OB} = 11\mathbf{i} + 2\mathbf{j} \\
\mathbf{c} &= \overrightarrow{AB} = \mathbf{b} - \mathbf{a} \\
&= (11\mathbf{i} + 2\mathbf{j}) - (3\mathbf{i} + 4\mathbf{j}) \\
&= 8\mathbf{i} - 2\mathbf{j}
\end{align*}
\]

You can see from the diagram that the vector \( \overrightarrow{AB} \) goes 8 units 'across' and 2 units 'down'.
• You can write a vector with Cartesian components as a column matrix:

\[ \mathbf{x} + y \mathbf{j} = \begin{pmatrix} x \\ y \end{pmatrix} \]

**Example 12**

Given that \( \mathbf{a} = 2\mathbf{i} + 5\mathbf{j} \), \( \mathbf{b} = 12\mathbf{i} - 10\mathbf{j} \), and \( \mathbf{c} = -3\mathbf{i} + 9\mathbf{j} \), find \( \mathbf{a} + \mathbf{b} + \mathbf{c} \) using column matrix notation in your working.

\[ \mathbf{a} + \mathbf{b} + \mathbf{c} = \begin{pmatrix} 2 \\ 5 \end{pmatrix} + \begin{pmatrix} 12 \\ -10 \end{pmatrix} + \begin{pmatrix} -3 \\ 9 \end{pmatrix} = \begin{pmatrix} 11 \\ 4 \end{pmatrix} \]

Add the numbers in the top line to get 11 (the x component), and the bottom line to get 4 (the y component). This is \( 11\mathbf{i} + 4\mathbf{j} \).

• The modulus (or magnitude) of \( x\mathbf{i} + y\mathbf{j} \) is \( \sqrt{x^2 + y^2} \)

**Example 13**

The vector \( \mathbf{a} \) is equal to \( 5\mathbf{i} - 12\mathbf{j} \).

Find \( |\mathbf{a}| \), and find a unit vector in the same direction as \( \mathbf{a} \).

\[ |\mathbf{a}| = \sqrt{5^2 + (-12)^2} = \sqrt{169} = 13 \]

Unit vector is \( \frac{\mathbf{a}}{|\mathbf{a}|} \) Look back to Section 7.2.

\[ = \frac{5\mathbf{i} - 12\mathbf{j}}{13} \]

or \( \frac{5}{13}\mathbf{i} - \frac{12}{13}\mathbf{j} \)

or \( \frac{1}{13}\begin{pmatrix} 5 \\ -12 \end{pmatrix} \)

**Example 14**

Given that \( \mathbf{a} = 5\mathbf{i} + \mathbf{j} \) and \( \mathbf{b} = -2\mathbf{i} - 4\mathbf{j} \), find the exact value of \( |2\mathbf{a} + \mathbf{b}| \).

\[ 2\mathbf{a} + \mathbf{b} = 2\begin{pmatrix} 5 \\ 1 \end{pmatrix} + \begin{pmatrix} -2 \\ -4 \end{pmatrix} = \begin{pmatrix} 10 \\ -2 \end{pmatrix} = \begin{pmatrix} 8 \\ -2 \end{pmatrix} \]

\[ |2\mathbf{a} + \mathbf{b}| = \sqrt{8^2 + (-2)^2} = \sqrt{68} = \sqrt{4 \times 17} = 2\sqrt{17} \]

You must give the answer as a surd because the question asks for an exact answer.
**Exercise 7D**

1. Given that \( \mathbf{a} = 9\mathbf{i} + 7\mathbf{j} \), \( \mathbf{b} = 11\mathbf{i} - 3\mathbf{j} \) and \( \mathbf{c} = -8\mathbf{i} - \mathbf{j} \), find:
   - \( \mathbf{a} + \mathbf{b} + \mathbf{c} \)
   - \( 2\mathbf{a} - \mathbf{b} + \mathbf{c} \)
   - \( 2\mathbf{b} + 2\mathbf{c} - 3\mathbf{a} \)
   (Use column matrix notation in your working.)

2. The points \( A, B \) and \( C \) have coordinates \((3, -1), (4, 5)\) and \((-2, 6)\) respectively, and \( O \) is the origin.
   Find, in terms of \( \mathbf{i} \) and \( \mathbf{j} \):
   - \( \mathbf{a} \) the position vectors of \( A, B \) and \( C \)
   - \( \overrightarrow{AB} \)
   - \( \overrightarrow{AC} \)
   Find, in surd form:
   - \( |\overrightarrow{OC}| \)
   - \( |\overrightarrow{AB}| \)
   - \( |\overrightarrow{AC}| \)

3. Given that \( \mathbf{a} = 4\mathbf{i} + 3\mathbf{j} \), \( \mathbf{b} = 5\mathbf{i} - 12\mathbf{j} \), \( \mathbf{c} = -7\mathbf{i} + 24\mathbf{j} \) and \( \mathbf{d} = \mathbf{i} - 3\mathbf{j} \), find a unit vector in the direction of \( \mathbf{a}, \mathbf{b}, \mathbf{c} \) and \( \mathbf{d} \).

4. Given that \( \mathbf{a} = 5\mathbf{i} + \mathbf{j} \) and \( \mathbf{b} = \lambda\mathbf{i} + 3\mathbf{j} \), and that \( |3\mathbf{a} + \mathbf{b}| = 10 \), find the possible values of \( \lambda \).

**Mixed Exercise 7E**

1. Given that \( 2\mathbf{p} - 3\mathbf{q} = \begin{pmatrix} 5 \\ 3 \end{pmatrix} \), where \( \mathbf{p} = \begin{pmatrix} 4 \\ 10 \end{pmatrix} \), \( \mathbf{q} = \begin{pmatrix} \frac{1}{2} \\ 3 \end{pmatrix} \) and \( m \) and \( n \) are constants, find the values of \( m \) and \( n \).

2. If \( \mathbf{r} = \begin{pmatrix} -4 \\ -1 \end{pmatrix} \), \( \mathbf{s} = \begin{pmatrix} 5 \\ 7 \end{pmatrix} \) and \( mr + ns = \begin{pmatrix} 7 \\ 37 \end{pmatrix} \), find constants \( m \) and \( n \).

3. In the diagram, \( OXYZ \) is a parallelogram. \( M \) is the mid-point of \( XY \).

   ![Diagram](image)

   a. Given that \( \overrightarrow{OX} = \begin{pmatrix} 8 \\ 0 \end{pmatrix} \) and \( \overrightarrow{OZ} = \begin{pmatrix} -2 \\ 6 \end{pmatrix} \), write down the vectors \( \overrightarrow{XM} \) and \( \overrightarrow{XZ} \).

   b. Given that \( \overrightarrow{ON} = v\overrightarrow{OM} \), write down in terms of \( v \) the vector \( \overrightarrow{ON} \).

   c. Given that \( \overrightarrow{ON} = \overrightarrow{OX} + w\overrightarrow{XZ} \), find in terms of \( w \) the vector \( \overrightarrow{ON} \).

   d. Solve two simultaneous equations to find \( v \) and \( w \).
4. ABCD is a parallelogram in which \( \overline{AB} = x \) and \( \overline{BC} = y \).
AE:ED = 1:2.

a. Express in terms of \( x \) and \( y \), \( \overline{AC} \) and \( \overline{BE} \).

b. AC and BE intersect at F, such that \( \overline{BF} = v\overline{BE} \).
   i. Express \( \overline{BF} \) in terms of \( x \), \( y \) and \( v \).
   ii. Show that \( \overline{AF} = (1 - v)x + \frac{1}{2}vy \).
   iii. Use this expression for \( \overline{AF} \) to find the value of \( v \).

5. Two vectors are defined as \( \mathbf{v} = \begin{pmatrix} 3 \\ 1 \end{pmatrix} \) and \( \mathbf{w} = \begin{pmatrix} 1 \\ 4 \end{pmatrix} \).
Express \( \mathbf{v} + \mathbf{w} \), \( 2\mathbf{v} - \mathbf{w} \) and \( \mathbf{v} - 2\mathbf{w} \) as column vectors, find the magnitude and draw the resultant vector triangle for each vector.

6. Two vectors are defined as \( \mathbf{p} = \begin{pmatrix} -2 \\ -1 \end{pmatrix} \) and \( \mathbf{q} = \begin{pmatrix} 3 \\ 5 \end{pmatrix} \).
Express \( \mathbf{p} + \mathbf{q} \), \( 3\mathbf{p} + \mathbf{q} \) and \( \mathbf{p} - 3\mathbf{q} \) as column vectors, find the magnitude and draw the resultant vector triangle for each vector.

7. Chloe, Leo and Max enter an orienteering competition. Each decides to take a different route, described using these column vectors, where the units are in km:
\[
\mathbf{s} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \quad \mathbf{t} = \begin{pmatrix} 2 \\ 3 \end{pmatrix}
\]
They all start from the same point P and take 3 hours to complete their routes.

Chloe: \( \mathbf{s} + 2\mathbf{t} \)
Leo: \( 2\mathbf{s} + \mathbf{t} \)
Max: \( 5\mathbf{s} - \mathbf{t} \)

a. Express each journey as a column vector.

b. Find the length of each journey, and hence calculate the average speed of each orienteer in km/hour.
Chapter 7: Summary

1. A vector is a quantity that has both magnitude and direction.

2. Vectors that are equal have both the same magnitude and the same direction.

3. Two vectors are added using the ‘triangle law’.

4. Adding the vectors \( \overrightarrow{PQ} \) and \( \overrightarrow{QP} \) gives the zero vector \( \mathbf{0} \).
   \[ (\overrightarrow{PQ} + \overrightarrow{QP} = \mathbf{0}) \]

5. The modulus of a vector is another name for its magnitude.
   - The modulus of the vector \( \mathbf{a} \) is written as \( |\mathbf{a}| \).
   - The modulus of the vector \( \overrightarrow{PQ} \) is written as \( |\overrightarrow{PQ}| \).

6. The vector \( -\mathbf{a} \) has the same magnitude as the vector \( \mathbf{a} \) but is in the opposite direction.

7. Any vector parallel to the vector \( \mathbf{a} \) may be written as \( \lambda \mathbf{a} \), where \( \lambda \) is a non-zero scalar.

8. \( \mathbf{a} - \mathbf{b} \) is defined to be \( \mathbf{a} + (-\mathbf{b}) \).

9. A unit vector is a vector which has magnitude (or modulus) 1 unit.

10. If \( \lambda \mathbf{a} + \mu \mathbf{b} = \alpha \mathbf{a} + \beta \mathbf{b} \), and the non-zero vectors \( \mathbf{a} \) and \( \mathbf{b} \) are not parallel, then \( \lambda = \alpha \) and \( \mu = \beta \).

11. The position vector of a point \( A \) is the vector \( \overrightarrow{OA} \), where \( O \) is the origin. \( \overrightarrow{OA} \) is usually written as vector \( \mathbf{a} \).

12. \( \overrightarrow{AB} = \mathbf{b} - \mathbf{a} \), where \( \mathbf{a} \) and \( \mathbf{b} \) are the position vectors of \( A \) and \( B \) respectively.

13. The modulus (or magnitude) of \( x\mathbf{i} + y\mathbf{j} \) is \( \sqrt{x^2 + y^2} \).
Chapter 8: Rectangular Cartesian coordinates

8.1 You can write the equation of a straight line in the form \( y = mx + c \) or \( ax + by + c = 0 \).

- In the general form \( y = mx + c \), \( m \) is the gradient and \((0, c)\) is the intercept on the \( y \)-axis.

- In the general form \( ax + by + c = 0 \), \( a \), \( b \) and \( c \) are integers.

Example 1
Write down the gradient and intercept on the \( y \)-axis of these lines:

a \quad y = -3x + 2

b \quad 4x - 2y + 5 = 0

\[
\begin{align*}
a & \quad y = -3x + 2  \\
& \quad \text{The gradient} = -3 \text{ and the} \\
& \quad \text{intercept on the \( y \)-axis} = (0, 2). \\
b & \quad 4x - 2y + 5 = 0  \\
& \quad 4x + 5 = 2y  \\
& \quad 2y = 4x + 5  \\
& \quad y = 2x + \frac{5}{2}  \\
& \quad \text{The gradient} = 2 \text{ and the intercept} \\
& \quad \text{on the \( y \)-axis} = (0, \frac{5}{2}).
\end{align*}
\]

Compare \( y = -3x + 2 \) with \( y = mx + c \).  
From this, \( m = -3 \) and \( c = 2 \).

Rearrange the equation into the form \( y = mx + c \).
Add \( 2y \) to each side.
Put the term in \( y \) at the front of the equation.
Divide each term by 2, so that:

\[
\begin{align*}
2y + 2 & \quad = y  \\
4 + 2 & \quad = 2  \\
5 + 2 & \quad = \frac{5}{2}. \quad (\text{Do not write this as 2.5})
\end{align*}
\]

Compare \( y = 2x + \frac{5}{2} \) to \( y = mx + c \).
From this, \( m = 2 \) and \( c = \frac{5}{2} \).

Example 2
Write these lines in the form \( ax + by + c = 0 \):

a \quad y = 4x + 3

b \quad y = -\frac{1}{2}x + 5

\[
\begin{align*}
a & \quad \quad y = 4x + 3  \\
b & \quad \quad y = -\frac{1}{2}x + 5
\end{align*}
\]
\[ a \quad y = 4x + 3 \\
\quad 0 = 4x + 3 - y \]
So \[ 4x - y + 3 = 0 \]
Rearrange the equation into the form \( ax + by + c = 0 \).
Subtract \( y \) from each side.

\[ b \quad y = -\frac{1}{2}x + 5 \\
\quad \frac{1}{2}x + y = 5 \\
\quad \frac{1}{2}x + y - 5 = 0 \]
So \[ x + 2y - 10 = 0 \]
Collect all the terms on one side of the equation.
Add \( \frac{1}{2}x \) to each side.
Subtract 5 from each side.
Multiply each term by 2 to clear the fraction.

**Example 3**

A line is parallel to the line \( y = \frac{1}{2}x - 5 \) and its intercept on the \( y \)-axis is \((0, 1)\). Write down the equation of the line.

\[ y = \frac{1}{2}x + 1 \]
Remember that parallel lines have the same gradient.
Compare \( y = \frac{1}{2}x - 5 \) with \( y = mx + c \), so \( m = \frac{1}{2} \).
The gradient of the required line is \( \frac{1}{2} \).
The intercept on the \( y \)-axis is \((0, 1)\), so \( c = 1 \).

**Example 4**

A line is parallel to the line \( 6x + 3y - 2 = 0 \) and it passes through the point \((0, 3)\). Work out the equation of the line.

\[ 6x + 3y - 2 = 0 \]
Rearrange the equation into the form \( y = mx + c \) to find \( m \).
Subtract \( 6x \) from each side.
Add 2 to each side.
Divide each term by 3, so that
\[
3y + 3 = y \\
-6x + 3 = -2x \\
2 + 3 = \frac{2}{3} \quad \text{(Do not write this as a decimal.)}
\]
The gradient of this line is \(-2\).
The equation of the line is \( y = -2x + 3 \). Parallel lines have the same gradient, so the gradient of the required line = \(-2\). \((0, 3)\) is the intercept on the \( y \)-axis, so \( c = 3 \).

**Example 5**

The line \( y = 4x - 8 \) meets the \( x \)-axis at the point \( P \). Work out the coordinates of \( P \).

\[ y = 4x - 8 \]
The line meets the \( x \)-axis when \( y = 0 \), so substitute \( y = 0 \) into \( y = 4x - 8 \).
Substituting,
\[ 4x - 8 = 0 \]
Rearrange the equation for \( x \).
\[ 4x = 8 \]
Add 8 to each side.
\[ x = 2 \]
Divide each side by 4.
So \( P(2, 0) \).
Always write down the coordinates of the point.
Exercise 8A

1 Work out the gradients of these lines:
   a. \( y = -2x + 5 \)
   b. \( y = -x + 7 \)
   c. \( y = 4 + 3x \)
   d. \( y = \frac{1}{2}x - 2 \)
   e. \( y = -\frac{2}{5}x \)
   f. \( y = \frac{5}{4}x + \frac{2}{3} \)
   g. \( 2x - 4y + 5 = 0 \)
   h. \( 10x - 5y + 1 = 0 \)
   i. \( -x + 2y - 4 = 0 \)
   j. \( -3x + 6y + 7 = 0 \)
   k. \( 4x + 2y - 9 = 0 \)
   l. \( 9x + 6y + 2 = 0 \)

2 These lines intercept the \( y \)-axis at \((0, c)\). Work out the value of \( c \) in each case.
   a. \( y = -x + 4 \)
   b. \( y = 2x - 5 \)
   c. \( y = \frac{1}{2}x - \frac{2}{3} \)
   d. \( y = -3x \)
   e. \( y = \frac{5}{7}x + \frac{7}{5} \)
   f. \( y = 2 - 7x \)
   g. \( 3x - 4y + 8 = 0 \)
   h. \( 4x - 5y + 10 = 0 \)
   i. \( -2x + y - 9 = 0 \)
   j. \( 7x + 4y + 12 = 0 \)
   k. \( 7x - 2y + 3 = 0 \)
   l. \( -5x + 4y + 2 = 0 \)

3 Write these lines in the form \( ax + by + c = 0 \).
   a. \( y = 4x + 3 \)
   b. \( y = 3x - 2 \)
   c. \( y = -6x + 7 \)
   d. \( y = \frac{4}{5}x - 6 \)
   e. \( y = \frac{5}{7}x + 2 \)
   f. \( y = \frac{7}{3}x \)
   g. \( y = 2x - \frac{4}{7} \)
   h. \( y = -3x + \frac{2}{5} \)
   i. \( y = -6x - \frac{2}{3} \)
   j. \( y = -\frac{1}{3}x + \frac{1}{2} \)
   k. \( y = \frac{2}{7}x + \frac{5}{6} \)
   l. \( y = \frac{3}{5}x + \frac{1}{2} \)

4 A line is parallel to the line \( y = 5x + 8 \) and its intercept on the \( y \)-axis is \((0, 3)\). Write down the equation of the line.

5 A line is parallel to the line \( y = -\frac{1}{2}x + 1 \) and its intercept on the \( y \)-axis is \((0, -4)\). Work out the equation of the line. Write your answer in the form \( ax + by + c = 0 \), where \( a \), \( b \) and \( c \) are integers.

6 A line is parallel to the line \( 3x + 6y + 11 = 0 \) and its intercept on the \( y \)-axis is \((0, 7)\). Write down the equation of the line.

7 A line is parallel to the line \( 2x - 3y - 1 = 0 \) and it passes through the point \((0, 0)\). Write down the equation of the line.

8 The line \( y = 6x - 18 \) meets the \( x \)-axis at the point \( P \). Work out the coordinates of \( P \).

9 The line \( 3x + 2y - 5 = 0 \) meets the \( x \)-axis at the point \( R \). Work out the coordinates of \( R \).

10 The line \( 5x - 4y + 20 = 0 \) meets the \( y \)-axis at the point \( A \) and the \( x \)-axis at the point \( B \). Work out the coordinates of the points \( A \) and \( B \).
8.2 You can work out the gradient \( m \) of the line joining the point with coordinates \((x_1, y_1)\) to the point with coordinates \((x_2, y_2)\) by using the formula \( m = \frac{y_2 - y_1}{x_2 - x_1} \).

![Graph showing gradient calculation]

**Example 6**

Work out the gradient of the line joining the points \((2, 3)\) and \((5, 7)\).

1. **Draw a sketch.**
   - \( 7 - 3 = 4 \)
   - \( 5 - 2 = 3 \)

2. **Remember the gradient of a line**
   \[ m = \frac{\text{difference in } y\text{-coordinates}}{\text{difference in } x\text{-coordinates}} \]

3. **So**
   \[ m = \frac{7 - 3}{5 - 2} = \frac{4}{3} \]

4. **This is**
   \[ m = \frac{y_2 - y_1}{x_2 - x_1} \text{ with } (x_1, y_1) = (2, 3) \]
   and \((x_2, y_2) = (5, 7)\).

The gradient of the line is \( \frac{4}{3} \).

**Example 7**

Work out the gradient of the line joining these pairs of points:

- a \((-2, 7)\) and \((4, 5)\)
- b \((2d, -5d)\) and \((6d, 3d)\)

**a**

\[
\begin{align*}
m &= \frac{5 - 7}{4 - (-2)} \\
&= \frac{-2}{6} \\
&= \frac{-1}{3} \\
\end{align*}
\]

The gradient of the line is \( \frac{-1}{3} \).

**b**

\[
\begin{align*}
m &= \frac{3d - (-5d)}{6d - 2d} \\
&= \frac{8d}{4d} \\
&= 2 \\
\end{align*}
\]

The gradient of the line is 2.
Example 8

The line joining (2, −5) to (4, a) has gradient −1. Work out the value of a.

\[ \frac{a - (-5)}{4 - 2} = -1 \]

So \[ \frac{a + 5}{2} = -1 \]

Use \( m = \frac{y_2 - y_1}{x_2 - x_1} \). Here \( m = -1 \),

\( (x_1, y_1) = (2, -5) \) and \( (x_2, y_2) = (4, a) \).

\[ a + 5 = -2 \]

Multiply each side of the equation by 2 to clear the fraction.

\[ a = -7 \]

Subtract 5 from each side of the equation.

Exercise 8B

1. Work out the gradient of the line joining these pairs of points:
   a. (4, 2), (6, 3)
   b. (−1, 3), (5, 4)
   c. (−4, 5), (1, 2)
   d. (2, −3), (6, 5)
   e. (−3, 4), (7, −6)
   f. (−12, 3), (−2, 8)
   g. (−2, −4), (10, 2)
   h. \( \left(\frac{1}{2}, 2\right) \), \( \left(\frac{3}{4}, 4\right) \)
   i. \( \left(\frac{1}{4}, \frac{1}{2} \right) \), \( \left(\frac{1}{2}, \frac{2}{3} \right) \)
   j. (−2.4, 9.6), (0, 0)
   k. (1.3, −2.2), (8.8, −4.7)
   l. (0, 5a), (10a, 0)
   m. (3b, −2b), (7b, 2b)
   n. \( (p, p^3) \), \( (q, q^3) \)

2. The line joining (3, −5) to (6, a) has gradient 4. Work out the value of a.

3. The line joining (5, b) to (8, 3) has gradient −3. Work out the value of b.

4. The line joining (c, 4) to (7, 6) has gradient \( \frac{3}{4} \). Work out the value of c.

5. The line joining (−1, 2d) to (1, 4) has gradient \( -\frac{1}{3} \). Work out the value of d.

6. The line joining (−3, −2) to (2e, 5) has gradient 2. Work out the value of e.

7. The line joining (7, 2) to (f, 3f) has gradient 4. Work out the value of f.

8. The line joining (3, −4) to (−g, 2g) has gradient −3. Work out the value of g.

9. Show that the points A(2, 3), B(4, 4), C(10, 7) can be joined by a straight line. 
   (Hint: Find the gradient of the lines joining the points: \( \text{i} \) A and B and \( \text{ii} \) A and C.)

10. Show that the points (−2a, 5a), (0, 4a), (6a, a) are collinear (i.e. on the same straight line).
8.3 You can find the equation of a line with gradient $m$ that passes through the point with coordinates $(x_1, y_1)$ by using the formula $y - y_1 = m(x - x_1)$.

Example 9
Find the equation of the line with gradient 5 that passes through the point (3, 2).

$(x, y)$ is any point on the line.

The gradient $= 5$, so $\frac{y - 2}{x - 3} = 5$.

$y - 2 = 5(x - 3)$
$y - 2 = 5x - 15$
$y = 5x - 13$

Multiply each side of the equation by $x - 3$ to clear the fraction, so that:

$\frac{y - 2}{x - 3} \times \frac{x - 3}{1} = y - 2$
$5 \times (x - 3) = 5(x - 3)$

This is in the form $y - y_1 = m(x - x_1)$.
Here $m = 5$ and $(x_1, y_1) = (3, 2)$.

Expand the brackets.
Add 2 to each side.

Example 10
Find the equation of the line with gradient $-\frac{1}{2}$ that passes through the point (4, -6).

$y - (-6) = -\frac{1}{2}(x - 4)$
So $y + 6 = -\frac{1}{2}(x - 4)$

Use $y - y_1 = m(x - x_1)$. Here $m = -\frac{1}{2}$ and $(x_1, y_1) = (4, -6)$.

Expand the brackets. Remember $-\frac{1}{2} \times -4 = +2$.
Subtract 6 from each side.

Example 11
The line $y = 3x - 9$ meets the $x$-axis at the point $A$. Find the equation of the line with gradient $\frac{1}{2}$ that passes through the point $A$. Write your answer in the form $ax + by + c = 0$, where $a$, $b$ and $c$ are integers.
Exercise 8C

1 Find the equation of the line with gradient \( m \) that passes through the point \((x_1, y_1)\) when:
   a \( m = 2 \) and \((x_1, y_1) = (2, 5)\)
   b \( m = 3 \) and \((x_1, y_1) = (-2, 1)\)
   c \( m = -1 \) and \((x_1, y_1) = (3, -6)\)
   d \( m = -4 \) and \((x_1, y_1) = (-2, -3)\)
   e \( m = \frac{1}{2} \) and \((x_1, y_1) = (-4, 10)\)
   f \( m = -\frac{1}{2} \) and \((x_1, y_1) = (-6, -1)\)
   g \( m = 2 \) and \((x_1, y_1) = (a, 2a)\)
   h \( m = -\frac{1}{2} \) and \((x_1, y_1) = (-2b, 3b)\)

2 The line \( y = 4x - 8 \) meets the x-axis at the point \( A \). Find the equation of the line with gradient 3 that passes through the point \( A \).

3 The line \( y = -2x + 8 \) meets the y-axis at the point \( B \). Find the equation of the line with gradient 2 that passes through the point \( B \).

4 The line \( y = \frac{1}{2}x + 6 \) meets the x-axis at the point \( C \). Find the equation of the line with gradient \( \frac{1}{2} \) that passes through the point \( C \). Write your answer in the form \( ax + by + c = 0 \), where \( a \), \( b \) and \( c \) are integers.

5 The line \( y = \frac{1}{2}x + 2 \) meets the y-axis at the point \( B \). The point \( C \) has coordinates \((-5, 3)\). Find the gradient of the line joining the points \( B \) and \( C \).

6 The lines \( y = x \) and \( y = 2x - 5 \) intersect at the point \( A \). Find the equation of the line with gradient \( \frac{2}{3} \) that passes through the point \( A \).

7 The lines \( y = 4x - 10 \) and \( y = x - 1 \) intersect at the point \( T \). Find the equation of the line with gradient \( -\frac{2}{3} \) that passes through the point \( T \). Write your answer in the form \( ax + by + c = 0 \), where \( a \), \( b \) and \( c \) are integers.

**Hint:**
Solve \( y = x \) and \( y = 2x - 5 \) simultaneously.
8. The line \( p \) has gradient \( \frac{2}{3} \) and passes through the point \((6, -12)\). The line \( q \) has gradient \(-1\) and passes through the point \((5, 5)\). The line \( p \) meets the \( y \)-axis at \( A \) and the line \( q \) meets the \( x \)-axis at \( B \). Work out the gradient of the line joining the points \( A \) and \( B \).

9. The line \( y = -2x + 6 \) meets the \( x \)-axis at the point \( P \). The line \( y = \frac{3}{2}x - 4 \) meets the \( y \)-axis at the point \( Q \). Find the equation of the line joining the points \( P \) and \( Q \).

10. The line \( y = 3x - 5 \) meets the \( x \)-axis at the point \( M \). The line \( y = -\frac{2}{3}x + \frac{2}{3} \) meets the \( y \)-axis at the point \( N \). Find the equation of the line joining the points \( M \) and \( N \). Write your answer in the form \( ax + by + c = 0 \), where \( a \), \( b \) and \( c \) are integers.

8.4 You can work out the gradient of a line that is perpendicular to the line \( y = mx + c \).

- If a line has a gradient of \( m \), a line perpendicular to it has a gradient of \(-\frac{1}{m}\).
- If two lines are perpendicular, the product of their gradients is \(-1\).

Example 12
Work out the gradient of the line that is perpendicular to the lines with these gradients:

\[
a \quad m = 3 \quad b \quad m = \frac{1}{2} \quad c \quad m = -\frac{2}{5}
\]

\( a \) \hspace{1cm} \( m = 3 \)
So the gradient of the perpendicular line is \(-\frac{1}{3}\).
Use \(-\frac{1}{m}\) with \( m = 3 \).

\( b \) \hspace{1cm} \( m = \frac{1}{2} \)
So the gradient of the perpendicular line is

\[
-\frac{1}{\left(\frac{1}{2}\right)} = -\frac{2}{1} = -2
\]
Use \(-\frac{1}{m}\) with \( m = \frac{1}{2} \).
Remember \( \frac{1}{\left(\frac{a}{b}\right)} = \frac{b}{a} \), so \(-\frac{1}{\left(\frac{1}{2}\right)} = -2 \).

\( c \) \hspace{1cm} \( m = -\frac{2}{5} \)
So the gradient of the perpendicular line is

\[
-\frac{1}{\left(-\frac{2}{5}\right)} = -\frac{5}{2}
\]
Use \(-\frac{1}{m}\) with \( m = -\frac{2}{5} \).
Here \( \frac{1}{\left(\frac{2}{5}\right)} = \frac{5}{2} \), so \(-\frac{1}{\left(-\frac{2}{5}\right)} = \frac{5}{2} \).
Example 13

Show that the line \( y = 3x + 4 \) is perpendicular to the line \( x + 3y - 3 = 0 \).

\[ y = 3x + 4 \]

The gradient of this line is 3.

\[ x + 3y - 3 = 0 \]
\[ 3y = -x + 3 \]
\[ y = -\frac{1}{3}x + 1 \]

The gradient of this line is \(-\frac{1}{3}\).

\[ 3 \times -\frac{1}{3} = -1 \]

The lines are perpendicular because the product of their gradients is \(-1\).

Compare \( y = 3x + 4 \) with \( y = mx + c \), so \( m = 3 \).

Rearrange the equation into the form \( y = mx + c \) to find \( m \).

Subtract \( x \) from each side.

Add 3 to each side.

Divide each term by 3.

\[ -x + 3 = -\frac{x}{3} = -\frac{1}{3}x \]

Compare \( y = -\frac{1}{3}x + 1 \) with \( y = mx + c \), so \( m = -\frac{1}{3} \).

Multiply the gradients of the lines.

Example 14

Work out whether these pairs of lines are parallel, perpendicular or neither:

\[ \begin{align*}
\text{a} & \quad y = -2x + 9 \\
& \quad y = -2x - 3 \\
\text{b} & \quad 3x - y - 2 = 0 \\
& \quad x + 3y - 6 = 0 \\
\text{c} & \quad y = \frac{1}{2}x \\
& \quad 2x - y + 4 = 0
\end{align*} \]

\[ \begin{align*}
\text{a} & \quad y = -2x + 9 \\
& \quad y = -2x - 3 \\
\text{b} & \quad 3x - y - 2 = 0 \\
& \quad 3x - 2 = y \\
\text{c} & \quad y = \frac{1}{2}x \\
& \quad 2x - y + 4 = 0
\end{align*} \]

\( y \) is compared with \( y = mx + c \), so \( m = -2 \).

\( y \) is compared with \( y = mx + c \), so \( m = -2 \).

Remember that parallel lines have the same gradient.

\[ 3 \times -\frac{1}{3} = -1 \]

So the lines are parallel, since the gradients are equal.

The gradient of this line is 3.

\[ x + 3y - 6 = 0 \]
\[ 3y - 6 = -x \]
\[ 3y = -x + 6 \]
\[ y = -\frac{x}{3} + 2 \]

The gradient of this line is \(-\frac{1}{3}\).

So the lines are perpendicular as \( 3 \times -\frac{1}{3} = -1 \).
c \[ y = \frac{1}{2}x \quad \text{Compare } y = \frac{1}{2}x \text{ with } y = mx + c, \text{ so } m = \frac{1}{2}. \]

The gradient of this line is \( \frac{1}{2} \).

\[
2x - y + 4 = 0
\]

\[
2x + 4 = y
\]

So \[ y = 2x + 4 \]

The gradient of this line is 2. \[ y = 2x + 4 \text{ with } y = mx + c, \text{ so } m = 2. \]

The lines are not parallel as they have different gradients.

The lines are not perpendicular as \( \frac{1}{2} \times 2 = 1 \).

**Example 15**

Find an equation of the line that passes through the point \((3, -1)\) and is perpendicular to the line \(y = 2x - 4\).

\[
y = 2x - 4
\]

\[
m = 2
\]

So the gradient of the perpendicular line is \(-\frac{1}{2}\).

\[
y - (-1) = -\frac{1}{2}(x - 3)
\]

\[
y + 1 = -\frac{1}{2}x + \frac{3}{2}
\]

\[
y = -\frac{1}{2}x + \frac{1}{2}
\]

**Exercise 8D**

1. Work out whether these pairs of lines are parallel, perpendicular or neither:
   a \[ y = 4x + 2 \]
      \[ y = \frac{4}{3}x - 7 \]
   b \[ y = \frac{5}{3}x - 1 \]
      \[ y = \frac{5}{3}x - 11 \]
   c \[ y = \frac{1}{2}x + 9 \]
      \[ y = 5x + 9 \]
   d \[ y = -3x + 2 \]
      \[ y = \frac{1}{3}x - 7 \]
   e \[ y = \frac{3}{5}x + 4 \]
      \[ y = -\frac{2}{3}x - 1 \]
   f \[ y = \frac{3}{5}x \]
      \[ y = \frac{2}{3}x - 3 \]
   g \[ y = 5x - 3 \]
      \[ 5x - y + 4 = 0 \]
   h \[ 5x - y - 1 = 0 \]
      \[ y = -\frac{5}{2}x \]
   i \[ y = -\frac{3}{2}x + 8 \]
      \[ 2x - 3y - 9 = 0 \]
   j \[ 4x - 5y + 1 = 0 \]
      \[ 8x - 10y = 2 = 0 \]
   k \[ 3x + 2y - 12 = 0 \]
      \[ 2x + 3y = 0 \]
   l \[ 5x - y + 2 = 0 \]
      \[ 2x + 10y - 4 = 0 \]

2. Find an equation of the line that passes through the point \((6, -2)\) and is perpendicular to the line \(y = 3x + 5\).

3. Find an equation of the line that passes through the point \((-2, 7)\) and is parallel to the line \(y = 4x + 1\). Write your answer in the form \(ax + by + c = 0\).
4 Find an equation of the line:
   a parallel to the line \( y = -2x - 5 \), passing through \((-\frac{1}{2}, \frac{1}{2})\)
   b parallel to the line \( x - 2y - 1 = 0 \), passing through \((0, 0)\)
   c perpendicular to the line \( y = x - 4 \), passing through \((-1, -2)\)
   d perpendicular to the line \( 2x + y - 9 = 0 \), passing through \((4, -6)\).

5 Find an equation of the line:
   a parallel to the line \( y = 3x + 6 \), passing through \((-2, 5)\)
   b perpendicular to the line \( y = 3x + 6 \), passing through \((-2, 5)\)
   c parallel to the line \( 4x - 6y + 7 = 0 \), passing through \((3, 4)\)
   d perpendicular to the line \( 4x - 6y + 7 = 0 \), passing through \((3, 4)\).

6 Find an equation of the line that passes through the point \((5, -5)\) and is perpendicular to the line \( y = \frac{2}{3}x + 5 \). Write your answer in the form \( ax + by + c = 0 \), where \(a\), \(b\) and \(c\) are integers.

7 Find an equation of the line that passes through the point \((-2, -3)\) and is perpendicular to the line \( y = -\frac{2}{3}x + 5 \). Write your answer in the form \( ax + by + c = 0 \), where \(a\), \(b\) and \(c\) are integers.

8 The line \(r\) passes through the points \((1, 4)\) and \((6, 8)\) and the line \(s\) passes through the points \((5, -3)\) and \((20, 9)\). Show that the lines \(r\) and \(s\) are parallel.

9 The line \(l\) passes through the points \((-3, 0)\) and \((3, -2)\) and the line \(n\) passes through the points \((1, 8)\) and \((-1, 2)\). Show that the lines \(l\) and \(n\) are perpendicular.

10 The vertices of a quadrilateral \(ABCD\) has coordinates \(A(-1, 5)\), \(B(7, 1)\), \(C(5, -3)\), \(D(-3, 1)\). Show that the quadrilateral is a rectangle.

8.5 **You can find the distance \(d\) between \((x_1, y_1)\) and \((x_2, y_2)\) by using the formula**

\[
d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}
\]

**Example 16**

Find the distance between these pairs of points:

\(a\) \((2, 3), (5, 7)\) \(b\) \((4a, a), (-3a, 2a)\)

\(a\)

\[
\begin{align*}
   &\text{Draw a sketch.} \\
   &\text{Let the distance between the points be } d. \\
   &\text{The difference in the } y\text{-coordinates is} \\
   &\quad 7 - 3 = 4. \\
   &\text{The difference in the } x\text{-coordinates is} \\
   &\quad 5 - 2 = 3. \\
   &\text{Use Pythagoras' theorem:} \\
   &\quad d^2 = (x_2 - x_1)^2 + (y_2 - y_1)^2 \\
   &\quad d^2 = 3^2 + 4^2 \\
   &\quad d = \sqrt{3^2 + 4^2} \\
   &\quad d = \sqrt{25} \\
   &\quad d = 5
\end{align*}
\]

\(b\)

\[
\begin{align*}
   &\text{Use Pythagoras' theorem:} \\
   &\quad d^2 = (x_2 - x_1)^2 + (y_2 - y_1)^2 \\
   &\quad d^2 = (4a - a)^2 + (2a - a)^2 \\
   &\quad d^2 = 3a^2 + a^2 \\
   &\quad d = \sqrt{3a^2 + a^2} \\
   &\quad d = \sqrt{4a^2} \\
   &\quad d = 2a
\end{align*}
\]

This is \(d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}\) with \((x_1, y_1) = (2, 3)\) and \((x_2, y_2) = (5, 7)\).
\[ d = \sqrt{[(-3a - 4a)^2 + (2a - a)^2]} \]

Use \( d = \sqrt{[(x_2 - x_1)^2 + (y_2 - y_1)^2]} \). Here \((x_1, y_1) = (4a, a)\) and \((x_2, y_2) = (-3a, 2a)\).

\[ (-7a)^2 = 49a^2 \]

\[ 49a^2 = 7a \times 7a \]

\[ 50a^2 = 49a^2 \]

\[ \sqrt{25 	imes 2 	imes a^2} \]

\[ \sqrt{25} \times \sqrt{2} \times \sqrt{a^2} \]

\[ 5\sqrt{2a} \]

Simplify.

**Exercise 8E**

Find the distance between these pairs of points:

1. \((0, 1), (6, 9)\)
2. \((4, 6), (9, 6)\)
3. \((3, 1), (-1, 4)\)
4. \((3, 5), (4, 7)\)
5. \((2, 9), (4, 3)\)
6. \((0, -4), (5, 5)\)
7. \((-2, -7), (5, 1)\)
8. \((-4a, 0), (3a, -2a)\)
9. \((-b, 4b), (-4b, -2b)\)
10. \((2c, c), (6c, 4c)\)
11. \((-4d, d), (2d, -4d)\)
12. \((-e, -e), (-3e, -5e)\)

**8.6 You can find the coordinates of a point that divides a line in a given ratio.**

The coordinates of the point dividing the line joining \((x_1, y_1)\) and \((x_2, y_2)\) in the ratio \(m:n\) are given by \(\left(\frac{nx_1 + mx_2}{m+n}, \frac{ny_1 + my_2}{m+n}\right)\).

In Exercise 7B you saw how to find the position vector of such a point.

Using the vector triangle: \(r = a + \frac{m}{m+n} \overrightarrow{AB} = a + \frac{m}{m+n}(b - a)\)

and so \(r = \frac{(m+n)a + mb - ma}{m+n} = \frac{ma + mb}{m + n}\)

and this coordinate formula uses the same idea with \(a = (x_1, y_1)\) and \(b = (x_2, y_2)\).
Example 17

The coordinates of the point \( C \) that divides \( AB \) in the ratio 1:3

\[
C = \frac{3(-1) + 1 \times 3}{1 + 3} \times 3 \times 5 + 1 \times 9
\]

Use the formula. Remember the second part of the ratio (the 3) multiplies the first point (\( A \)'s) coordinates.

\[C = \left( 0, \frac{1 \times 9}{4} \right)\]

so \( C = (0, 6) \)

Exercise 8F

1. Find the coordinates of the point which divides \( AB \) in the given ratio:
   a. \( A (0, 6); B (4, 10) \) ratio 3:1
   b. \( A (1, 5); B (-2, 8) \) ratio 1:2
   c. \( A (3, -7); B (-2, 8) \) ratio 3:2
   d. \( A (-2, 5); B (5, 2) \) ratio 4:3

2. Find the midpoint of the line joining the following pairs of points:
   a. (4, 2) and (6, 8)
   b. (0, 6) and (12, 2)
   c. (2, 2) and (4, 6)
   d. (-6, 4) and (6, -4)

Mixed Exercise 8G

1. The points \( A \) and \( B \) have coordinates (-4, 6) and (2, 8) respectively. A line \( l \) is drawn through \( B \) perpendicular to \( AB \) to meet the \( y \)-axis at the point \( C \).
   a. Find an equation of the line \( p \).
   b. Determine the coordinates of \( C \).

2. The line \( l \) has equation \( 2x - y - 1 = 0 \).
   The line \( m \) passes through the point \( A(0, 4) \) and is perpendicular to the line \( l \).
   a. Find an equation of \( m \) and show that the lines \( l \) and \( m \) intersect at the point \( P(2, 3) \).
   The line \( n \) passes through the point \( B(3, 0) \) and is parallel to the line \( m \).
   b. Find an equation of \( n \) and hence find the coordinates of the point \( Q \) where the lines \( l \) and \( n \) intersect.

3. The line \( L_1 \) has gradient \( \frac{1}{2} \) and passes through the point \( A(2, 2) \). The line \( L_2 \) has gradient \(-1 \) and passes through the point \( B(4, 8) \). The lines \( L_1 \) and \( L_2 \) intersect at the point \( C \).
   a. Find an equation for \( L_1 \) and an equation for \( L_2 \).
   b. Determine the coordinates of \( C \).

4. The straight line passing through the point \( P(2, 1) \) and the point \( Q(k, 11) \) has gradient \(-\frac{3}{12} \).
   a. Find the equation of the line in terms of \( x \) and \( y \) only.
   b. Determine the value of \( k \).

5. a. Find an equation of the line \( l \) which passes through the points \( A(1, 0) \) and \( B(5, 6) \).
   The line \( m \) with equation \( 2x + 3y = 15 \) meets \( l \) at the point \( C \).
   b. Determine the coordinates of the point \( C \).
6 The line $L$ passes through the points $A(1, 3)$ and $B(-19, -19)$.
Find an equation of $L$ in the form $ax + by + c = 0$, where $a$, $b$ and $c$ are integers.

7 The straight line $l_1$ passes through the points $A$ and $B$ with coordinates $(2, 2)$ and $(6, 0)$ respectively.
   a Find an equation of $l_1$.
The straight line $l_2$ passes through the point $C$ with coordinates $(-9, 0)$ and has gradient $\frac{1}{3}$.
   b Find an equation of $l_2$.

8 The straight line $l_1$ passes through the points $A$ and $B$ with coordinates $(0, -2)$ and $(6, 7)$ respectively.
   a Find the equation of $l_1$ in the form $y = mx + c$.
The straight line $l_2$ with equation $x + y = 8$ cuts the $y$-axis at the point $C$. The lines $l_1$ and $l_2$ intersect at the point $D$.
   b Calculate the coordinates of the point $D$.
   c Calculate the area of $\triangle ACD$.

9 The points $A$ and $B$ have coordinates $(2, 16)$ and $(12, -4)$ respectively. A straight line $l_1$ passes through $A$ and $B$.
   a Find an equation for $l_1$ in the form $ax + by + c = 0$.
The line $l_2$ passes through the point $C$ with coordinates $(-1, 1)$ and has gradient $\frac{1}{3}$.
   b Find an equation for $l_2$.

10 The points $A(-1, -2)$, $B(7, 2)$ and $C(k, 4)$, where $k$ is a constant, are the vertices of $\triangle ABC$. Angle $ABC$ is a right angle.
   a Find the gradient of $AB$.
   b Calculate the value of $k$.
   c Find an equation of the straight line passing through $B$ and $C$. Give your answer in the form $ax + by + c = 0$, where $a$, $b$ and $c$ are integers.

11 The point $C$ divides the line joining $A(-1, 1)$ and $B(4, 11)$ in the ratio $3 : 2$.
   a Find the coordinates of the point $C$.
The line $l$ is perpendicular to $AB$ and passes through the point $C$.
   b Find an equation of $l$, giving your answer in the form $ax + by + c = 0$, where $a$, $b$ and $c$ are integers.
The line $l$ cuts the $y$-axis at the point $D$.
   c Write down the coordinates of $D$.
   d Find the area of triangle $ABD$.

12 The points $A$ and $B$ have coordinates $(k, 1)$ and $(8, 2k - 1)$ respectively, where $k$ is a constant. Given that the gradient of $AB$ is $\frac{1}{2}$:
   a show that $k = 2$
   b find an equation for the line through $A$ and $B$. 

© Edexcel Limited
1. In the general form of the equation of a straight line \( y = mx + c \),
m is the gradient and \( (0, c) \) is the intercept on the y-axis.
2. Another general form of the equation of a straight line that you may see is
\( ax + by + c = 0 \),
where \( a, b \) and \( c \) are integers.

2. You can work out the gradient \( m \) of the line joining the point with coordinates \((x_1, y_1)\) to the point with coordinates \((x_2, y_2)\) by using the formula
\[
m = \frac{y_2 - y_1}{x_2 - x_1}
\]

3. You can find the equation of a line with gradient \( m \) that passes through the point with coordinates \((x_1, y_1)\) by using the formula
\[
y - y_1 = m(x - x_1)
\]

4. If a line has a gradient \( m \), a line perpendicular to it has a gradient of \( -\frac{1}{m} \).

5. If two lines are perpendicular, the product of their gradients is \(-1\).

6. The coordinates of the point dividing the line joining \((x_1, y_1)\) and \((x_2, y_2)\) in the ratio \( m : n \)
are given by \( \left( \frac{mx_1 + mx_2}{m + n}, \frac{ny_1 + my_2}{m + n} \right) \).
Chapter 9: Calculus

9.1 You can find the gradient function \( f'(x) \) of a curve when \( f(x) = x^a \).

Consider the gradient of the chord \( BC \) where \( B \) and \( C \) are two points on the (red) curve. If you let \( h \) get smaller (mathematically we say \( h \rightarrow 0 \)) then the point \( C \) will move closer to the point \( B \) and the gradient of the blue chord will get closer to the gradient of the green tangent.

This is the basic idea behind the process of differentiation and there are some simple rules which you will need to learn:

- **If** \( y = f(x) = x^n \) **then the gradient function** \( f'(x) = nx^{n-1} \)

Sometimes we write \( \frac{dy}{dx} = f'(x) \).

**Example 1**

Find \( f'(x) \) when \( f(x) \) equals:

<table>
<thead>
<tr>
<th></th>
<th>( f(x) )</th>
<th>( f'(x) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>( x^6 )</td>
<td>( 6x^5 )</td>
</tr>
<tr>
<td>b</td>
<td>( x^{\frac{1}{2}} )</td>
<td>( \frac{1}{2}x^{-\frac{1}{2}} )</td>
</tr>
<tr>
<td>c</td>
<td>( x^{-2} )</td>
<td>( -2x^{-3} )</td>
</tr>
<tr>
<td>d</td>
<td>( \frac{x}{x^3} )</td>
<td>( \frac{1}{x^2} )</td>
</tr>
<tr>
<td>e</td>
<td>( x^2 \times x^1 )</td>
<td>( 3x )</td>
</tr>
</tbody>
</table>

- The power 6 is reduced to power 5 and the 6 multiplies the answer.
- The power \( \frac{1}{2} \) is reduced to \( \frac{1}{2} - 1 = -\frac{1}{2} \), and the \( \frac{1}{2} \) multiplies the answer. This can be rewritten in an alternative form.
- The power -2 is reduced to -3 and the -2 multiplies the answer. This can be rewritten in an alternative form using knowledge of negative powers.
d Let \( f(x) = x + x^5 \)
\[ = x^{-4} \quad \text{Simplify using rules of powers to give one}
\quad \text{simple power, i.e. subtract } 1 - 5 = -4. \]
So \( f'(x) = -4x^{-5} \)
\[ = -\frac{4}{x^5} \quad \text{Reduce the power } -4 \text{ to give } -5, \text{ then multiply}
\quad \text{your answer by } -4. \]

e Let \( f(x) = x^2 \times x^3 \).
\[ = x^5 \quad \text{Add the powers this time to give } 2 + 3 = 5. \]
So \( f'(x) = 5x^4 \)
\[ \quad \text{Reduce the power } 5 \text{ to } 4 \text{ and multiply your}
\quad \text{answer by } 4. \]

**Exercise 9A**

Find \( f'(x) \), given \( f(x) \) equals:

<p>| | | | | |</p>
<table>

**9.2 You can differentiate a function that is a multiple of powers of \( x \).**

You saw that if \( y = x^n \), then \( \frac{dy}{dx} = nx^{n-1} \).

This is true for all real values of \( n \).

It can also be shown that

- if \( y = ax^n \), where \( a \) is a constant then \( \frac{dy}{dx} = anx^{n-1} \).

**Hint:**

Note that you again reduce the power by 1 and the original power multiplies the expression.

Also

- if \( y = f(x) \pm g(x) \) then \( \frac{dy}{dx} = f'(x) \pm g'(x) \).

For the International GCSE these standard results can be assumed without proof.

**Example 2**

Use standard results to differentiate:

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>( x^3 + x^2 - x^{1/2} )</td>
<td>b</td>
<td>( 2x^{-3} )</td>
<td>c</td>
</tr>
<tr>
<td>a</td>
<td>( y = x^3 + x^2 - x^{1/2} )</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
So \( \frac{dy}{dx} = 3x^2 + 2x - \frac{1}{2}x^{-1/2} \)
\[ \quad \text{Differentiate each term as you come to it.} \]
First \( x^3 \), then \( x^2 \), then \( -x^{1/2} \).
\[y = 2x^{-3}\]

So \[
\frac{dy}{dx} = -6x^{-4}.
\]

Differentiate \(x^{-3}\), then multiply the answer by 2.

\[x = \frac{1}{3}x^{\frac{1}{2}} + 4x^2\]

So \[
\frac{dy}{dx} = \frac{1}{3} \times \frac{1}{2}x^{-\frac{1}{2}} + 8x
\]

Take each term as you come to it, and treat each term as a multiple.

Sometimes you may need to expand or simplify an expression before you can differentiate it.

**Example 3**

Use standard results to differentiate:

\[a \quad \frac{1}{4\sqrt{x}} \quad b \quad x^3(3x + 1) \quad c \quad \frac{x - 2}{x^2}\]

\[a \quad \text{Let} \quad y = \frac{1}{4\sqrt{x}} = \frac{1}{4}x^{-\frac{1}{2}} \quad \text{Express the 4 in the denominator as a multiplier of} \frac{1}{4} \text{ and express the} x \text{ term as power} -\frac{1}{2}.
\]

Therefore \[
\frac{dy}{dx} = -\frac{1}{8}x^{-\frac{3}{2}}
\]

Then differentiate by reducing the power of \(x\) and multiplying \(\frac{1}{4}\) by \(-\frac{3}{2}\).

\[b \quad \text{Let} \quad y = x^3(3x + 1) = 3x^4 + x^3 \quad \text{Multiply out the brackets to give a polynomial function.}
\]

Therefore \[
\frac{dy}{dx} = 12x^3 + 3x^2
\]

Differentiate each term.

\[c \quad \text{Let} \quad y = \frac{x - 2}{x^2} = \frac{1}{x} - \frac{2}{x^2} \quad \text{Express the single fraction as two separate fractions. and simplify} \frac{x}{x^2} \text{ as} \frac{1}{x^3}.
\]

Therefore \[
\frac{dy}{dx} = -x^{-2} + 4x^{-3}
\]

Then express the rational expressions as negative powers of \(x\), and differentiate.

\[= -\frac{1}{x^2} + \frac{4}{x^3}
\]

\[= -\frac{x + 4}{x^3}
\]

Simplify by using a common denominator.

**Example 4**

Find the gradient of the curve \(y = x^3 - 3x^2 + 2x - 1\) at the point (3, 5).

\[y = x^3 - 3x^2 + 2x - 1 \quad \text{First differentiate to determine the gradient of the curve.}
\]

\[
\frac{dy}{dx} = 3x^2 - 6x + 2
\]

Then substitute for \(x\) to calculate the value of the gradient of the curve and of the tangent when \(x = 3\). When \(x = 3\), the gradient is 11.
Exercise 9B

1 Use standard results to differentiate:
   a \( x^2 + x^{-1} \)  
   b \( \frac{1}{x^2} \)  
   c \( 2x^{-\frac{1}{2}} \)

2 Find the gradient of the curve with equation \( y = f(x) \) at the point \( A \) where:
   a \( f(x) = x^3 - 3x + 2 \) and \( A \) is at \( (-1, 4) \) 
   b \( f(x) = 3x^2 + 2x^{-1} \) and \( A \) is at \( (2, 13) \)

3 Find the point or points on the curve with equation \( y = f(x) \), where the gradient is zero:
   a \( f(x) = x^2 - 5x \)  
   b \( f(x) = x^3 - 9x^2 + 24x - 20 \)  
   c \( f(x) = x^{-\frac{1}{2}} - 6x + 1 \)  
   d \( f(x) = x^{-1} + 4x \)

4 Use standard results to differentiate:
   a \( 2\sqrt{x} \)  
   b \( \frac{3}{x^2} \)  
   c \( \frac{1}{3x^3} \)  
   d \( \frac{1}{3x^3} \)  
   e \( \frac{2}{x^3} + \sqrt{x} \)  
   f \( \frac{1}{\sqrt{x}} + \frac{1}{2x} \)  
   g \( \frac{2x + 3}{x} \)  
   h \( \frac{3x^2 - 6}{x} \)  
   i \( \frac{2x^3 + 3x}{\sqrt{x}} \)  
   j \( x(x^2 - x + 2) \)  
   k \( 3x^2(x^2 + 2x) \)  
   l \( (3x - 2)(4x + \frac{1}{x}) \)

5 Find the gradient of the curve with equation \( y = f(x) \) at the point \( A \) where:
   a \( f(x) = x(x + 1) \) and \( A \) is at \( (0, 0) \)  
   b \( f(x) = \frac{2x - 6}{x^2} \) and \( A \) is at \( (3, 0) \)  
   c \( f(x) = \frac{1}{\sqrt{x}} \) and \( A \) is at \( (1, 2) \)  
   d \( f(x) = 3x - \frac{4}{x^2} \) and \( A \) is at \( (2, 5) \)

9.3 You can also differentiate \( e^{ax}, \sin ax \) and \( \cos ax \).

In section 10.1 you will learn about radians. Radians are simply an alternative way of measuring angles instead of degrees.

The conversion is simple

- \( \pi \) radians = 180 degrees

So for example 60° is the same as \( \frac{\pi}{3} \) radians and \( \frac{\pi}{2} \) radians is equivalent to 90°.

Your calculator can be set in radian “mode” and you should know how to do this. Try it now and then type in \( \cos \left( \frac{\pi}{3} \right) \) and you should get 0.5 since 60° is the same as \( \frac{\pi}{3} \) radians and \( \cos(60°) = 0.5 \).

The main reason for using radians is that they make the rules for differentiating \( \sin x \) and \( \cos x \) much simpler.

You need to learn the following:

- If \( y = \sin ax \) then \( \frac{dy}{dx} = a\cos ax \)
- If \( y = \cos ax \) then \( \frac{dy}{dx} = -a\sin ax \)

You can also differentiate the exponential function met in chapter 4

- If \( y = e^{ax} \) then \( \frac{dy}{dx} = ae^{ax} \)
Example 5
Differentiate

\( \text{a} \quad y = \sin 3x \quad \text{b} \quad y = 2 \sin 4x \quad \text{c} \quad y = 3 \cos 2x \quad \text{d} \quad y = 3e^{3x} \)

\( \frac{dy}{dx} = 3 \cos 3x \)

Use the formula with \( a = 3 \).

\( \frac{dy}{dx} = 2 \times 4 \cos 4x \)

\( = 8 \cos 4x \)

Remember from section 9.2 if \( y = kf(x) \) then \( \frac{dy}{dx} = kf'(x) \).

Then use the formula with \( a = 4 \).

\( \frac{dy}{dx} = 3 \times (-2) \sin 2x \)

\( = -6 \sin 2x \)

Remember the 3 does not change and use the formula with \( a = 2 \).

\( \frac{dy}{dx} = 3 \times 4e^{4x} \)

\( = 12e^{4x} \)

Use the formula with \( a = 4 \).

Exercise 9C

1. Differentiate

\( \text{a} \quad e^{2x} \quad \text{b} \quad e^{-3x} \quad \text{c} \quad e^x + 3x^2 \quad \text{d} \quad \sin 2x \quad \text{e} \quad \cos 3x \quad \text{f} \quad 3 \sin 4x + 4 \cos 3x \)

2. Find \( \frac{dy}{dx} \) when

\( \text{a} \quad y = \sin 5x \quad \text{b} \quad y = 2 \sin \frac{1}{2}x \quad \text{c} \quad y = \sin 8x \quad \text{d} \quad y = 6 \sin \frac{3}{2}x \quad \text{e} \quad y = 2 \cos x \quad \text{f} \quad y = 6 \cos \frac{5}{2}x \quad \text{g} \quad y = \cos 4x \quad \text{h} \quad y = 4 \cos \left( \frac{x}{2} \right) \)

3. Find the gradient of the curve with equation \( y = 2e^{-x} \) at the point \((0, 2)\).

4. Find the gradient of the curve with equation \( y = 3 \sin x \) at the point where \( x = \frac{\pi}{3} \).

5. Find the gradient of the curve with equation \( y = 4 \cos 2x \) at the point where \( x = \frac{\pi}{4} \).
9.4 You can use the chain rule, product rule and quotient rules to differentiate more complicated functions.

- If \( y = f(g(x)) \) then \( \frac{dy}{dx} = f'(g(x)) \times g'(x) \)

This is called the chain rule or differentiating a function of a function.

**Example 6**

Differentiate the following

<table>
<thead>
<tr>
<th>a</th>
<th>e^{x^2+x}</th>
<th>b</th>
<th>\sin(2x^2 + 3)</th>
<th>c</th>
<th>(3x^4 + 2)^5</th>
<th>d</th>
<th>\cos^3 x</th>
</tr>
</thead>
</table>

a  
\[ y = e^{x^2+x} \]
\[ \frac{dy}{dx} = e^{x^2+x} (2x + 1) \]
This comes from differentiating the exponential function \( f'(g(x)) \) since \( \frac{d(e^x)}{dx} = e^x \).

b  
\[ y = \sin(2x^2 + 3) \]
\[ \frac{dy}{dx} = \cos(2x^2 + 3) \times 4x \]
The \( \cos(...) \) comes from differentiating \( \sin(...) \) i.e. \( f'(g(x)) \).

The 4x comes from differentiating \( 2x^2 + 3 \).

c  
\[ y = (3x^4 + 2)^5 \]
\[ \frac{dy}{dx} = 5(3x^4 + 2)^4 \times 12x^3 \]
This is \( f'(g(x)) \).
\[ = 60x^3(3x^4 + 2)^4 \]
This is \( g'(x) \).

d  
\[ y = \cos^3 x \]
\[ \frac{dy}{dx} = 3 \cos^2 x \times (-\sin x) \]
This is \( f'(g(x)) \).
\[ = -3 \cos^2 x \sin x \]
The derivative of \( \cos x \) is \(-\sin x\).

To differentiate a product of two functions you use the product rule

- If \( y = uv \) then \( \frac{dy}{dx} = u \frac{dv}{dx} + v \frac{du}{dx} \)

**Example 7**

Differentiate

<table>
<thead>
<tr>
<th>a</th>
<th>( y = e^x \sin x )</th>
<th>b</th>
<th>( xe^{x^2} )</th>
<th>c</th>
<th>( y = x^2(3 + 2x)^4 )</th>
</tr>
</thead>
</table>

a  
\[ y = e^x \sin x \]
\[ \frac{dy}{dx} = e^x \cos x + e^x \sin x \]
Use the product rule with \( u = e^x \) and \( v = \sin x \).
b Let \( y = xe^{x^2} \)

Let \( u = x \) and \( v = e^{x^2} \)

Then \( \frac{du}{dx} = 1 \) and \( \frac{dv}{dx} = 2xe^{x^2} \). Use the product rule and then use the chain rule to differentiate \( e^{x^2} \).

\[
\frac{dy}{dx} = x(2xe^{x^2}) + e^{x^2} \]

\[
= e^{x^2}(2x^2 + 1) \]

Simplify the answer by factorising.

c \( y = x^2(3 + 2x)^4 \)

Use the product rule with \( u = x^2 \) and \( v = (3 + 2x)^4 \).

\[
\frac{dv}{dx} = x^2 \times 4(3 + 2x)^3 \times 2 + 2x \times (3 + 2x)^4 \]

Use the chain rule to find \( \frac{dv}{dx} \) where \( v = (3 + 2x)^4 \).

\[
= 8x^2(3 + 2x)^3 + 2x(3 + 2x)^4 \]

\[
= 2x(3 + 2x)^3[4x + 3 + 2x] \]

\[
= 2x(3 + 2x)^3[6x + 3] \]

\[
= 6x(3 + 2x)^3[2x + 1] \]

Simplify your answer if possible.

To differentiate a quotient you can use the quotient rule

\( \frac{dy}{dx} = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2} \)

**Example 8**

Differentiate

a \( y = \frac{x}{2x + 5} \)

b \( y = \frac{e^{2x + 3}}{x} \)

c \( y = \frac{e^x}{\sin x} \)

a Let \( u = x \) and \( v = 2x + 5 \)

\[
\frac{du}{dx} = 1 \quad \text{and} \quad \frac{dv}{dx} = 2
\]

Using \( \frac{dy}{dx} = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2} \)

\[
\frac{dy}{dx} = \frac{(2x + 5) \times 1 - x \times 2}{(2x + 5)^2}
\]

Recognise that \( y \) is a quotient and use the quotient rule.

\[
= \frac{5}{(2x + 5)^2}
\]

Simplify the numerator of the fraction.
b. Let \( y = \frac{e^{2x} + 3}{x} \)

Then \( \frac{dy}{dx} = \frac{x \times 2e^{2x} + 3 - e^{2x} + 3}{x^2} \)

\[ = \frac{(2x - 1)e^{2x} + 3}{x^3} \]

Use the quotient rule, together with the chain rule to differentiate \( e^{2x} + 3 \).

c. \( y = \frac{e^x}{\sin x} \)

\[ \frac{dy}{dx} = \frac{\sin x \times e^x - e^x \times \cos x}{\sin^2 x} \]

\[ = \frac{e^x(\sin x - \cos x)}{\sin^2 x} \]

Use the quotient rule with \( u = e^x \) and \( v = \sin x \).

---

**Exercise 9D**

1. Differentiate
   
   a. \( (1 + 2x)^4 \)
   
   b. \( (1 + x^2)^3 \)
   
   c. \( (3 + 4x)^3 \)
   
   d. \( (x^2 + 2x)^3 \)

2. Differentiate
   
   a. \( 4e^{3x^2} \)
   
   b. \( 9e^{3-x} \)
   
   c. \( e^{-6x} \)
   
   d. \( e^{x^2 + 2x} \)

3. Differentiate
   
   a. \( \sin(2x + 1) \)
   
   b. \( \cos(2x^2 + 4) \)
   
   c. \( \sin^3 x \)
   
   d. \( \cos^2 2x \)

4. Differentiate
   
   a. \( x(1 + 3x)^5 \)
   
   b. \( 2x(1 + 3x^3)^3 \)
   
   c. \( x^3(2x + 6)^4 \)

5. Differentiate
   
   a. \( xe^{2x} \)
   
   b. \( (x^2 + 3)e^{-x} \)
   
   c. \( (3x - 5)e^{x^2} \)

6. Differentiate
   
   a. \( x \sin x \)
   
   b. \( \sin^2 x \cos x \)
   
   c. \( e^x \cos x \)

7. Differentiate
   
   a. \( \frac{5x}{x + 1} \)
   
   b. \( \frac{2x}{3x - 2} \)
   
   c. \( \frac{3x^2}{(2x - 1)^2} \)

8. Differentiate
   
   a. \( \frac{x}{e^{2x}} \)
   
   b. \( \frac{e^x}{x + 1} \)
   
   c. \( \frac{e^{x^2}}{x} \)

9. Differentiate
   
   a. \( \frac{\sin x}{x} \)
   
   b. \( \frac{e^x}{\cos x} \)
   
   c. \( \frac{\sin^2 x}{e^{2x}} \)

10. Find the gradient of the following curves at the points indicated
    
    a. \( y = x^2(3x - 1)^3 \) at the point \((1, 8)\)
    
    b. \( y = (2x + 3)e^{2x} \) at the point \((0, 3)\)
    
    c. \( y = 3 \sin^2 x \) at the point \(\left(\frac{\pi}{4}, \frac{3}{2}\right)\)
    
    d. \( y = x \cos x \) at the point \(\left(\frac{\pi}{2}, 0\right)\)
9.5 You can use differentiation to find the gradient of a tangent to a curve and you can then find the equation of the tangent and normal to that curve at a specified point.

The tangent at the point \( A (a, f(a)) \) has gradient \( f'(a) \). You can use the formula for the equation of a straight line, \( y - y_1 = m(x - x_1) \), to obtain the equation of the tangent at \( A (a, f(a)) \).

- **The equation of the tangent to a curve at a point \( A (a, f(a)) \) is \( y - f(a) = f'(a)(x - a) \).**

The normal to the curve at the point \( A \) is defined as being the straight line through \( A \) which is perpendicular to the tangent at \( A \) (see sketch alongside).

The gradient of the normal is \(-\frac{1}{f'(a)}\) because the product of the gradients of lines which are at right angles is \(-1\).

- **The equation of the normal at point \( A \) is \( y - f(a) = -\frac{1}{f'(a)}(x - a) \).**

**Example 9**

Find the equation of the tangent to the curve \( y = x^3 - 3x^2 + 2x - 1 \) at the point \( (3, 5) \).

\[ y = x^3 - 3x^2 + 2x - 1 \]
\[ \frac{dy}{dx} = 3x^2 - 6x + 2 \]  
First differentiate to determine the gradient of the curve and therefore the gradient of the tangent.

When \( x = 3 \), the gradient is 11.

So the equation of the tangent at \( (3, 5) \) is

\[ y - 5 = 11(x - 3) \]
\[ y = 11x - 28 \]  
You can now use the line equation and simplify.

**Example 10**

Find the equation of the normal to the curve with equation \( y = 3 \cos 2x \) at the point \( \left( \frac{\pi}{4}, 0 \right) \)

\[ \frac{dy}{dx} = 3(-\sin 2x) \times 2 \]  
Using the chain rule.

\[ = -6 \sin 2x \]  
Remember \( x \) is in radians.

Gradient of curve \(-6\)

Substitute \( x = \frac{\pi}{4} \) to find the gradient of the curve.

So gradient of normal \( \frac{1}{6} \)

The normal is perpendicular to the tangent so use the perpendicular gradient rule.

So equation of the normal is

\[ y - 0 = \frac{1}{6}(x - \frac{\pi}{4}) \]

i.e. \( y = \frac{1}{6}(x - \frac{\pi}{4}) \)
Exercise 9E

1. Find the equation of the tangent to the curve:
   a. \( y = x^2 - 7x + 10 \) at the point (2, 0)
   b. \( y = x + \frac{1}{x} \) at the point (2, 2.5)
   c. \( y = 2x - \frac{1}{x} \) at the point (1, 1)

2. Find the equation of the normal to the curves:
   a. \( y = x^2 - 5x \) at the point (6, 6)
   b. \( y = x^2 - \frac{8}{\sqrt{x}} \) at the point (4, 12)

3. For \( f(x) = 12 - 4x + 2x^2 \), find an equation of the tangent and normal at the point where \( x = 1 \) on the curve with equation \( y = f(x) \).

4. Find the equation of the tangent to the curve \( y = xe^{2x} \) at the point \( (\frac{1}{2}, \frac{1}{2}e) \).

5. Find the equation of the tangent to the curve \( y = \frac{e^x}{x} \) at the point \( (3, \frac{1}{3}e) \).

6. Find the equation of the tangent to the curve with equation \( y = x \sin x \) at the point \( (\pi, 0) \).

7. Find the equation of the normal to the curve with equation \( y = 2 \cos^2 x \) at the point \( (\frac{\pi}{4}, 1) \).

9.6  You can reverse the process of differentiation by integration.

You have seen that
if \( y = x^2 \) then \( \frac{dy}{dx} = 2x \) and if \( y = x^2 + 3 \) then \( \frac{dy}{dx} = 2x \) as well.

So if you were asked to find \( y \) given that \( \frac{dy}{dx} = 2x \) you cannot give a unique answer but can say that \( y = x^2 + c \) where \( c \) is some constant.

We call this process integration and write

\[
\int 2x \, dx = x^2 + c
\]

This symbol, which is an elongated "S" means integrate.

\( 2x \) is the expression to be integrated.

The dx tells you which letter is the variable to integrate; "dx" says integrate \( x \).

The rules for integration that you need for International GCSE are:

- \( \int x^n \, dx = \frac{x^{n+1}}{n+1} + c \quad (n \neq -1) \)
- \( \int e^{ax} \, dx = \frac{1}{a} e^{ax} + c \)
- \( \int \sin ax \, dx = -\frac{1}{a} \cos ax + c \)
- \( \int \cos ax \, dx = \frac{1}{a} \sin ax + c \)
Example 11

Find:

a \( \int (x^{3} + 2x^{3})dx \)

\[
= x^{3} + \frac{2x^4}{4} + c \\
= \frac{2}{3} x^3 + \frac{1}{2} x^4 + c
\]

First apply the rule term by term.

Then simplify each term.

b \( \int (x^{-\frac{3}{2}} + 2)dx \)

\[
= x^{-\frac{1}{2}} + 2x + c \\
= -2x^{-\frac{1}{2}} + 2x + c
\]

Remember \(-\frac{3}{2} + 1 = -\frac{1}{2}\) and the integral of a constant like 2 is 2x.

c \( \int (3x^2 + p^2x^{-2} + q)dx \)

\[
= \frac{3x^3}{3} + \frac{p^2}{-1} x^{-1} + qx + c \\
= x^3 - p^2x^{-1} + qx + c
\]

The dx tells you to integrate with respect to the variable x, so any other letters must be treated as constants.

d \( \int (4t^2 + 6)dt \)

\[
= \frac{4t^3}{3} + 6t + c
\]

The dt tells you that this time you must integrate with respect to t.

e \( \int x(x^2 + \frac{2}{x})dx \)

\[
= \int (x^3 + 2)dx \\
= \frac{x^4}{4} + 2x + c
\]

First multiply out the bracket.

Then apply the rule to each term.
**Example 12**

Find \( \int (2 \cos x + 3e^{-x} - \sin 2x) \, dx \)

Let \( I = \int (2 \cos x + 3e^{-x} - \sin 2x) \, dx \)

Then using the standard formulae integrate term by term

\[
\begin{align*}
\int 2 \cos x \, dx &= 2 \sin x \\
\int 3e^{-x} \, dx &= -3e^{-x} \\
\int \sin 2x \, dx &= -\frac{1}{2} \cos 2x
\end{align*}
\]

So \( I = 2 \sin x - 3e^{-x} + \frac{1}{2} \cos 2x + c \)

Integrate each term using the above rules. You only need one \(+c\) for the whole integral so this is best added at the end.

Add the \(+c\) at the end.

---

**Exercise 9F**

Find the following integrals.

1. \( \int (x^3 + 2x) \, dx \)
2. \( \int (2x^{-2} + 3) \, dx \)
3. \( \int (5x^2 - 3x^2) \, dx \)
4. \( \int (2x^{\frac{1}{2}} - 2x^{-\frac{1}{2}} + 4) \, dx \)
5. \( \int (4x^3 - 3x^{-4} + r) \, dx \)
6. \( \int (3t^2 - t^{-2}) \, dt \)
7. \( \int (2t^2 - 3t^{-\frac{1}{2}} + 1) \, dt \)
8. \( \int (x + x^{-\frac{1}{2}} - \frac{1}{2}) \, dx \)
9. \( \int (px^4 + 2t + 3x^{-2}) \, dx \)
10. \( \int (pt^3 + q^2 + px^3) \, dt \)

11. Find the following integrals:
   a. \( \int (2x + 3)x^2 \, dx \)
   b. \( \int \frac{(2x^2 + 3)}{x^2} \, dx \)
   c. \( \int (2x + 3)^2 \, dx \)
   d. \( \int (2x + 3)(x - 1) \, dx \)
   e. \( \int (2x + 3) \sqrt{x} \, dx \)

12. Integrate
   a. \( 2 \sin 3x \)
   b. \( 3e^{4x} \)
   c. \( 2 \cos 3x \)
   d. \( 2e^{-x} \)

13. Integrate the following with respect to \( x \):
   a. \( 5e^x - 4 \sin x + 2x^3 \)
   b. \( 2(\sin x - \cos x + x) \)
   c. \( 5e^x + 4 \cos x - \frac{2}{x^2} \)
   d. \( e^x + \sin x + \cos x \)

---

**9.7** You can apply calculus to problems involving displacement, velocity and acceleration.

- Displacement is represented by \( s \) and is a measure of distance: + or − indicates direction.
- Velocity is represented by \( v \) and is a measure of speed: + or − indicates direction.
- Acceleration is represented by \( a \) and is a measure of change in speed: + means the object is getting faster and − means it is getting slower.
The important relationships between these variables are:

\[ v = \frac{ds}{dt} \]
\[ a = \frac{dv}{dt} \quad \text{which can also be written as} \quad a = \frac{d^2s}{dt^2} \quad \text{This means take displacement and differentiate it twice.} \]

where \( t \) represents time.

**Example 13**

The velocity of a ball, \( v \text{ m/s} \), after \( t \) seconds is given by \( v = 8 + 10t - t^2 \).

a  Find the acceleration after \( t \) seconds.
b  Work out when the acceleration is zero.
c  Hence find the maximum velocity.

\[ a = \frac{dv}{dt} = 10 - 2t \]
\[ b \]
\[ 0 = 10 - 2t \]
\[ 2t = 10 \]
\[ t = 5 \text{ seconds} \]
\[ c \]
\[ \text{The maximum velocity occurs when } a = 0, \text{ when } t = 5. \]
\[ v(\text{max}) = 8 + 50 - 25 = 33 \text{ m/s} \]

**Example 14**

The velocity of a particle, \( v \text{ m/s} \), after \( t \) seconds is given by

\[ v = 12t - 8t^3 \quad (t > 0) \]

Given that the initial displacement is 10 m, find

a  an expression for \( s \) in terms of \( t \).
b  the displacement when \( t = 2 \).

\[ a \]
\[ s = \int v \, dt \]
\[ s = 6t^2 - 2t^4 + c \]
\[ t = 0, \quad s = 10 \text{ so } 10 = 0 + 0 + c \quad \text{so } c = 10 \]
\[ s = 6t^2 - 2t^4 + 10 \]
\[ b \]
\[ \text{When } t = 2 \]
\[ s = 24 - 32 + 10 \]
\[ = 2 \]

To find the displacement you have to integrate the velocity.

Use the given information about \( t = 0, \quad s = 10 \)

i.e. the "initial" conditions.

**Exercise 9G**

1  The displacement, \( s \) metres, of a particle after \( t \) seconds is given by \( s = 100 + 5t^2 \).

   Find an expression for the velocity, \( v = \frac{ds}{dt} \).

2  The displacement, \( s \) metres, of a particle after \( t \) seconds is given by \( s = 30 + 48t - 16t^2 \).

   Find an expression for the velocity, \( v = \frac{ds}{dt} \).
3 The displacement, s metres, of a particle after t seconds is given by \( s = 20 + 40t + 5t^2 \).
   a Find an expression for the velocity, \( v \).
   b Work out the velocity in m/s, after 3 seconds.

4 The displacement, s metres, of a particle after t seconds is given by \( s = 20 + 30t - 5t^2 \).
   a Find an expression for the velocity, \( v \).
   b Work out the velocity in m/s, after 3 seconds.

5 The velocity, \( v \) m/s, of a particle after t seconds is given by \( v = 32t + 100 \).
   a Find an expression for the acceleration, \( a = \frac{dv}{dt} \).
   Given that when \( t = 0 \) the displacement is 0
   b find an expression for the displacement \( s \).

6 The velocity, \( v \) m/s, of a particle after t seconds is given by \( v = 160 - 32t \).
   a Find an expression for the acceleration, \( a = \frac{dv}{dt} \).
   Given that when \( t = 0 \) the displacement is 384 m from the origin, find
   b an expression for the displacement \( s \).
   c the time when the particle passes through the origin.

7 The displacement, s metres, of a particle after t seconds is given by \( s = t^3 + 4t^2 - 5t + 2 \).
   a Find an expression for \( s \).
   b Find an expression for \( a \).
   c Work out, giving the correct units, the velocity and acceleration of the particle after one second.

8 The displacement, s metres, of a particle after t seconds is given by \( s = t^3 - 2t^2 + 3t + 1 \).
   a Find an expression for \( s \).
   b Find an expression for \( a \).
   c Work out, giving the correct units, the velocity and acceleration of the particle after two seconds.

9 The velocity, \( v \) m/s, of a particle after t seconds is given by \( v = t^2 + 10t + 5 \).
   a Find an expression for the acceleration, \( a \).
   b Work out the acceleration, in m/s\(^2\), after 2 seconds.
   The displacement \( s = 0 \) when \( t = 0 \).
   c Find the displacement when \( t = 2 \).

10 The velocity, \( v \) m/s, of a particle after t seconds is given by \( v = 24 + 6t - t^2 \).
    a Find an expression for the acceleration, \( a \).
    b Work out the acceleration, in m/s\(^2\), after 2 seconds.
    The displacement \( s = 100 \) when \( t = 3 \).
    c Find the expression for \( s \) in terms of \( t \).
9.8 You need to be able to find the coordinates of a stationary point on a curve and work out whether it is a minimum point or a maximum point.

- Points of zero gradient are called stationary points and stationary points may be maximum points, minimum points or neither.

**Hint:**
A is a maximum point.

**Hint:**
The origin is a stationary point but it is neither a maximum nor a minimum.

**Hint:**
B is a minimum point.

- To find the coordinates of a stationary point:
1. Find \( \frac{dy}{dx} \), i.e. \( f'(x) \), and solve the equation \( f'(x) = 0 \) to find the value, or values, of \( x \).
2. Substitute the value(s) of \( x \) which you have found into the equation \( y = f(x) \) to find the corresponding value(s) of \( y \).
3. This gives the coordinates of any stationary points.

- You can also find out whether stationary points are maximum points or minimum points by finding the value of \( \frac{d^2y}{dx^2} \) at the stationary point. This is because \( \frac{d^2y}{dx^2} \) measures the change in gradient.

**Hint:**
\( \frac{d^2y}{dx^2} \) is the second derivative of \( y \) with respect to \( x \).
You find \( \frac{d^2y}{dx^2} \) by differentiating \( \frac{dy}{dx} \) again with respect to \( x \).

If you imagine the diagram above shows a roller coaster and imagine yourself sitting in a carriage at one of the points A, O or B. At each of these points, you could remain stationary (hence the name **stationary points**).

Now imagine you are travelling along the roller coaster and think about your acceleration (you saw that this was given by the second derivative in section 9.7). 

As you approach A, you are getting slower so your acceleration \( a < 0 \).

As you approach B, you are getting faster so your acceleration \( a > 0 \).

This gives rise to the following tests for a maximum and a minimum point:
• If \( \frac{dy}{dx} = 0 \) and \( \frac{d^2y}{dx^2} < 0 \), the point is a maximum point.
• If \( \frac{dy}{dx} = 0 \) and \( \frac{d^2y}{dx^2} > 0 \), the point is a minimum point.

You may see the notation \( f''(x) \) used for the second derivative of \( f(x) \).

**Example 15**

Find the stationary points on the curve with equation \( y = 2x^3 - 15x^2 + 24x + 6 \) and determine, by finding the second derivative, whether the stationary points are maximum or minimum.

\[
y = 2x^3 - 15x^2 + 24x + 6
\]

Differentiate and put the derivative equal to zero.

\[
\frac{dy}{dx} = 6x^2 - 30x + 24
\]

Putting \( 6x^2 - 30x + 24 = 0 \)

Solve the equation to obtain the values of \( x \) for the stationary points.

So \( x = 4 \) or \( x = 1 \)

When \( x = 1 \),
\[
y = 2 - 15 + 24 + 6 = 17
\]

When \( x = 4 \),
\[
y = 2 \times 64 - 15 \times 16 + 24 \times 4 + 6 = -10
\]

So the stationary points are at \( (1, 17) \) and \( (4, -10) \)

Differentiate again to obtain the second derivative.

\[
\frac{d^2y}{dx^2} = 12x - 30
\]

When \( x = 1 \), \( \frac{d^2y}{dx^2} = -18 \) which is < 0

\( (1, 17) \) is a maximum point.

When \( x = 4 \), \( \frac{d^2y}{dx^2} = 18 \) which is > 0

\( (4, 1) \) is a minimum point

**Exercise 9H**

1. Find the least value of each of the following functions:
   - a. \( f(x) = x^2 - 12x + 8 \)
   - b. \( f(x) = x^2 - 8x - 1 \)
   - c. \( f(x) = 5x^2 + 2x \)

2. Find the greatest value of each of the following functions:
   - a. \( f(x) = 10 - 5x^2 \)
   - b. \( f(x) = 3 + 2x - x^2 \)
   - c. \( f(x) = (6 + x)(1 - x) \)
3 Find the coordinates of the points where the gradient is zero on the curves with the given equations. Establish whether these points are maximum points or minimum points, by considering the second derivative in each case.

\[
\begin{align*}
a &: y = 4x^2 + 6x \\
b &: y = 9 + x - x^2 \\
c &: y = x^3 - x^2 - x + 1 \\
d &: y = x(x^2 - 4x - 3) \\
e &: y = x + \frac{1}{x} \\
f &: y = x^2 + \frac{54}{x}
\end{align*}
\]

4 The maximum point on the curve with equation \( y = x\sqrt{\sin x} \), \( 0 < x < \pi \), is the point A. Show that the x-coordinate of point A satisfies the equation \( 2\tan x + x = 0 \).

5 \( f(x) = e^{2x} \sin 2x \), \( 0 \leq x \leq \pi \)

\[
\begin{align*}
a &: Use calculus to find the coordinates of the turning points on the graph of \( y = f(x) \).
b &: Show that \( f''(x) = 8e^{2x} \cos 2x \).
c &: Hence, or otherwise, determine which turning point is a maximum and which is a minimum.
\end{align*}
\]

9.9 You can use integration to find areas and volumes.

- **Area of region between** \( y = f(x) \), the x-axis and \( x = a \) and \( x = b \) is given by:

\[
\text{Area} = \int_a^b y \, dx
\]

This area can be thought of as a limit of a sum of approximate rectangular strips of width \( \delta x \) and length \( y \).

**Hint:** Since the strip is roughly rectangular the area is approximately \( y \delta x \).

Thus the area is the limit of \( \sum y \delta x \) as \( \delta x \to 0 \). The integration symbol \( \int \) is an elongated 'S' to represent this idea of a sum.

If each strip is now revolved through \( 2\pi \) radians (or 360 degrees) about the x-axis, it will form a shape that is approximately cylindrical. The volume of each cylinder will be \( \pi y^2 \delta x \) since the radius is \( y \) and the height is \( \delta x \).

The limit of the sum \( \sum \pi y^2 \delta x \), as \( \delta x \to 0 \), is given by \( \pi \int y^2 \, dx \) and this formula can be used to find the volume of the solid formed when the region \( R \) is rotated through \( 2\pi \) radians about the x-axis.

- **Volume of revolution formed when** \( y = f(x) \) **is rotated about the x-axis between** \( x = a \) **and** \( x = b \) **is given by:**

\[
\text{Volume} = \pi \int_a^b y^2 \, dx
\]
Example 16

Find the area of the region $R$ bounded by the curve with equation $y = (4 - x)(x + 2)$ and the positive $x$- and $y$-axes.

When $x = 0, y = 8$
When $y = 0, x = 4$ or $-2$

A sketch of the curve will often help in this type of question.

The area of $R$ is given by

$A = \int_{0}^{4} (4 - x)(x + 2) \, dx$

Multiply out the brackets.

So $A = \int_{0}^{4} (8 + 2x - x^2) \, dx$

Integrate.

$A = \left[ 8x + x^2 - \frac{x^3}{3} \right]_{0}^{4}$

Use limits of 4 and 0.

$A = \left( 32 + 16 - \frac{64}{3} \right) - (0)$

So the area is $26\frac{2}{3}$

Example 17

The region $R$ is bounded by the curve with equation $y = \sin 2x$, the $x$-axis and the lines $x = 0$ and $x = \frac{\pi}{2}$.

a Find the area of $R$.

b Find the volume of the solid formed when the region $R$ is rotated through $2\pi$ radians about the $x$-axis.

a Area $= \int_{0}^{\frac{\pi}{2}} \sin 2x \, dx$

$= \left[ -\frac{1}{2} \cos 2x \right]_{0}^{\frac{\pi}{2}}$

$= (-\frac{1}{2}(-1)) - (-\frac{1}{2})$

$= 1$
b Volume = \int_{-4}^{4} \sin^2 2x \, dx
\quad = \int_{-4}^{4} \frac{1}{2} (1 - \cos 4x) \, dx
\quad = \left[ \frac{1}{2} x - \frac{1}{8} \sin 4x \right]_{-4}^{4}
\quad = \left( \frac{\pi^2}{4} - 0 \right) - \left(0\right)
\quad = \frac{\pi^2}{4}

Use \cos 2A = 1 - 2 \sin^2 A.
Rearrange to give \sin^2 A = ...
Note that 2 \times 2x gives 4x in the cos term.
Multiply out and integrate.

In the examples so far the area that you were calculating was above the x-axis. If the area between a curve and the x-axis lies below the x-axis, then \( \int y \, dx \) will give a negative answer.

**Example 18**
Find the area of the finite region bounded by the curve \( y = x(x - 3) \) and the x-axis.

When \( x = 0, y = 0 \)
When \( y = 0, x = 0 \) or 3

First sketch the curve.
It is U-shaped. It crosses the x-axis at 0 and 3.

Area = \( \int_0^3 x(x - 3) \, dx \)
\quad = \int_0^3 (x^2 - 3x) \, dx
\quad = \left[ \frac{x^3}{3} - \frac{3x^2}{2} \right]_0
\quad = \left( \frac{27}{3} - \frac{27}{2} \right) - (0)
\quad = \frac{27}{6} - \frac{9}{2} = -4.5

So the area is 4.5
State the area as a positive quantity.
The following example shows that great care must be taken if you are trying to find an area which straddles the x-axis such as the shaded region below, bounded by the curve with equation \( y = (x + 1)(x - 1)x = x^3 - x \).

\[
\int_{-1}^{1} (x^3 - x) \, dx = \left[ \frac{x^4}{4} - \frac{x^2}{2} \right]_{-1}^{1} = \left( \frac{1}{4} - \frac{1}{2} \right) - \left( \frac{1}{4} - \frac{1}{2} \right) = 0
\]

Notice that:

\[
\int_{0}^{1} (x^3 - x) \, dx = \left[ \frac{x^4}{4} - \frac{x^2}{2} \right]_{0}^{1} = \left( \frac{1}{4} - \frac{1}{2} \right) - (0) = -\frac{1}{4}
\]

This is because:

\[
\int_{0}^{0} (x^3 - x) \, dx = \left[ \frac{x^4}{4} - \frac{x^2}{2} \right]_{0}^{0} = -\frac{1}{4} - \frac{1}{2} = \frac{1}{4}
\]

and \( \int_{-1}^{0} (x^3 - x) \, dx = \left[ \frac{x^4}{4} - \frac{x^2}{2} \right]_{-1}^{0} = \frac{1}{4} - \frac{1}{2} = \frac{1}{4} \)

So the area of the shaded region is actually \( \frac{1}{4} + \frac{1}{4} = \frac{1}{2} \).

For examples of this type you need to draw a sketch, unless one is given in the question.

**Example 19**

Sketch the curve with equation \( y = x(x - 1)(x + 3) \) and find the area of the finite region bounded by the curve and the x-axis.

When \( x = 0, y = 0 \)

When \( y = 0, x = 0, 1 \) or \( -3 \)

Find out where the curve intercepts the axes.

\( x \to \infty, y \to \infty \)

\( x \to -\infty, y \to -\infty \)

Find out what happens to \( y \) when \( x \) is large and positive or large and negative.

\[
\int_{-\infty}^{1} y \, dx + \int_{1}^{\infty} y \, dx
\]

Since the area between \( x = 0 \) and 1 is below the axis, the integral between these points will give a negative answer.

The area is given by \( \int_{-3}^{0} y \, dx + \int_{0}^{1} y \, dx \)
Now \[ \int y \, dx = \int (x^3 + 2x^2 - 3x) \, dx \]
\[ = \left[ \frac{x^4}{4} + \frac{2x^3}{3} - \frac{3x^2}{2} \right] \]
Multiply out the brackets.

So \[ \int_{-3}^{0} y \, dx = (0) - \left( \frac{81}{4} - \frac{2}{3} \times 27 - \frac{3}{2} \times 9 \right) \]
\[ = 11.25 \]
and \[ \int_{0}^{1} y \, dx = \left( \frac{1}{4} + \frac{2}{3} - \frac{3}{2} \right) - (0) \]
\[ = -\frac{7}{12} \]
So the area required is \( 11.25 + \frac{7}{12} = 11\frac{3}{8} \)

Sometimes you may wish to find an area between a curve and a line. (The method also applies to finding the area between two curves.)

You find the area of the shaded region by calculating \( \int_{a}^{b} (y_1 - y_2) \, dx \). This is because \( \int_{a}^{b} y_1 \, dx \) gives the area below the line (or curve) with equation \( y_1 \), and \( \int_{a}^{b} y_2 \, dx \) gives the area below \( y_2 \).

So the shaded region is simply \( \int_{a}^{b} y_1 \, dx - \int_{a}^{b} y_2 \, dx = \int_{a}^{b} (y_1 - y_2) \, dx \).

- **The area between a line (equation \( y_1 \)) and a curve (equation \( y_2 \)) is given by**

\[
\text{Area} = \int_{a}^{b} (y_1 - y_2) \, dx
\]

**Example 20**

The diagram shows a sketch of part of the curve with equation \( y = x(4 - x) \) and the line with equation \( y = x \).

Find the area of the region bounded by the curve and the line.
Method 1

\[ x = x(4 - x) \]
\[ x = 4x - x^2 \]
\[ x^2 - 3x = 0 \]
\[ x(x - 3) = 0 \]
So \[ x = 0 \] or \[ 3 \]
So the line cuts the curve at \((0, 0)\) and \((3, 3)\)

The area is given by \( \int_{0}^{3} [x(4 - x) - x] \, dx \)

\[ \text{Area} = \int_{0}^{3} \left(3x - x^2\right) \, dx \]
\[ = \left[ \frac{3}{2} x^2 - \frac{x^3}{3} \right]_{0}^{3} \]
\[ = \left( \frac{27}{2} - 9 \right) - (0) = 4.5 \]

First find where the line and the curve cross.

Find \( y \)-coordinates by substituting back in one of the equations. The line \( y = x \) is the simplest.

Use the formula with 'curve − line' since the curve is above the line.

Simplify the expression to be integrated.

Method 2

\begin{align*}
\text{Area beneath curve} & \quad \text{minus} \quad \text{Area of triangle} \\
\int_{0}^{3} (4x - x^2) \, dx & \quad - \quad \frac{1}{2} \times 3 	imes 3 \\
= \left[ \frac{2x^2}{2} - \frac{x^3}{3} \right]_{0}^{3} & \quad - \quad 4.5 \\
= \left[ 18 - \frac{27}{3} \right] - (0) & \quad - \quad 4.5 \\
& = 9 - 4.5 \\
& = 4.5
\end{align*}

You should notice that you could have found this area by first finding the area beneath the curve between \( x = 0 \) and \( x = 3 \), and then subtracting the area of a triangle.

The \( \int_{a}^{b} (y_1 - y_2) \, dx \) formula can be applied even if part of the region is below the \( x \)-axis.

Consider the following:
If both the curve and the line are translated upwards by \( +k \), where \( k \) is sufficiently large to ensure that the required area is totally above the \( x \)-axis, the diagram will look like this:

You should notice that since the translation is in the \( y \)-direction only, then the \( x \)-coordinates of the points of intersection are unchanged and so the limits of the integral will remain the same.

So the area in this case is given by:

\[
\int_a^b [y_1 + k - (y_2 + k)] \, dx
\]

\[
= \int_a^b (y_1 - y_2) \, dx
\]

Notice that the value of \( k \) does not appear in the final formula so you can always use this approach for questions of this type.

Sometimes you will need to add or subtract an area found by integration to the area of a triangle, trapezium or other similar shape as the following example shows.

**Example 21**

The diagram shows a sketch of the curve with equation \( y = x(x - 3) \) and the line with equation \( y = 2x \).

Find the area of the shaded region \( OAC \).

The required area is given by:

\[
\text{Area of triangle } OBC - \int_a^b x(x - 3) \, dx
\]

The curve cuts the \( x \)-axis at \( x = 3 \)

(and \( x = 0 \)) so \( a = 3 \)

The curve meets the line \( y = 2x \) when

\( 2x = x(x - 3) \)

So

\[
0 = x^2 - 5x
\]

\[
0 = x(x - 5)
\]

\[
x = 0 \text{ or } 5, \text{ so } b = 5
\]

The point \( C \) is \( (5, 10) \)

Area of triangle \( OBC = \frac{1}{2} \times 5 \times 10 = 25 \)

Line = curve.

Simplify the equation.

\[
y = 2 \times 5 = 10, \text{ substituting } x = 5
\]

into the equation of the line.
Area between curve, x-axis and the line \( x = 5 \) is

\[
\int_3^5 x(x - 3) \, dx = \int_3^5 (x^2 - 3x) \, dx
\]

\[
= \left[ \frac{x^3}{3} - \frac{3x^2}{2} \right]_3^5
\]

\[
= \left( \frac{125}{3} - \frac{75}{2} \right) - \left( \frac{27}{3} - \frac{27}{2} \right)
\]

\[
= \frac{25}{6} - \frac{27}{6}
\]

\[
= \frac{5}{6} \text{ or } \frac{26}{3}
\]

Shaded region is therefore \( 25 - \frac{26}{3} = \frac{49}{3} \text{ or } 16 \frac{1}{3} \)

---

**Exercise 91**

Sketch the following and find the area of the finite region or regions bounded by the curves and the x-axis.

1. \( y = x(x + 2) \)
2. \( y = (x + 1)(x - 4) \)
3. \( y = (x + 3)x(x - 3) \)
4. \( y = x^2(x - 2) \)
5. \( y = x(x - 2)(x - 5) \)

6. Find the area between the curve with equation \( y = f(x) \), the x-axis and the lines \( x = a \) and \( x = b \) in each of the following cases:
   a. \( f(x) = 3x^2 - 2x + 2; \quad a = 0, b = 2 \)
   b. \( f(x) = x^3 + 4x; \quad a = 1, b = 2 \)
   c. \( f(x) = \sqrt{x} + 2x; \quad a = 1, b = 4 \)
   d. \( f(x) = 7 + 2x - x^2; \quad a = -1, b = 2 \)
   e. \( f(x) = \frac{8}{x^3} + \sqrt{x}; \quad a = 1, b = 4 \)

7. The diagram shows part of the curve with equation \( y = x^2 + 2 \) and the line with equation \( y = 6 \). The line cuts the curve at the points A and B.
   a. Find the coordinates of the points A and B.
   b. Find the area of the finite region bounded by AB and the curve.

8. The diagram shows the finite region, R, bounded by the curve with equation \( y = 4x - x^2 \) and the line \( y = 3 \).
   a. Find the coordinates of the points A and B.
   b. Find the area of R.
9 The diagram shows a sketch of part of the curve with equation \( y = 9 - 3x - 5x^2 - x^3 \) and the line with equation \( y = 4 - 4x \). The line cuts the curve at the points \( A(-1, 8) \) and \( B(1, 0) \).
Find the area of the shaded region between \( AB \) and the curve.

[Diagram of a parabola and a line intersecting at points A and B]

10 The diagram shows the finite region \( R \), bounded by the curve with equation \( y = x(4 + x) \), the line with equation \( y = 12 \) and the \( y \)-axis.
(a) Find the coordinate of the point \( A \) where the line meets the curve.
(b) Find the area of \( R \).

[Diagram of a parabola and a line intersecting at points A and B]

11 The diagram shows part of a sketch of the curve with equation \( y = \frac{2}{x^2} + x \).
The points \( A \) and \( B \) have \( x \)-coordinates \( \frac{1}{2} \) and 2 respectively.
Find the area of the finite region between \( AB \) and the curve.

[Diagram of a curve with points A and B]

9.10 You can relate one rate of change to another.

You can use the chain rule once, or several times, to connect the rates of change in a question involving more than two variables.

**Example 22**

Given that the area of a circle \( A \) cm\(^2\) is related to its radius \( r \) cm by the formula \( A = \pi r^2 \), and that the rate of change of its radius in cm s\(^{-1}\) is given by \( \frac{dr}{dt} = 5 \), find \( \frac{dA}{dt} \) when \( r = 3 \).

\[
A = \pi r^2
\]

\[
\frac{dA}{dr} = 2\pi r
\]

As \( A \) is a function of \( r \), find \( \frac{dA}{dr} \).

Using \( \frac{dA}{dt} = \frac{dA}{dr} \times \frac{dr}{dt} \),

\[
\frac{dA}{dt} = 2\pi r \times 5
\]

\[
= 30\pi, \text{ when } r = 3.
\]

You should use the chain rule, giving the derivative which you need to find in terms of known derivatives.
Example 23

The volume of a hemisphere $V \text{ cm}^3$ is related to its radius $r \text{ cm}$ by the formula $V = \frac{2}{3} \pi r^3$ and the total surface area $S \text{ cm}^2$ is given by the formula $S = \pi r^2 + 2 \pi r^2 = 3 \pi r^2$. Given that the rate of increase of volume (in $\text{cm}^3 \text{s}^{-1}$) $\frac{dV}{dt} = 6$, find the rate of increase of surface area $\frac{dS}{dt}$.

$V = \frac{2}{3} \pi r^3$ and $S = 3 \pi r^2$ - This is area of circular base plus area of curved surface.

$\frac{dV}{dr} = 2 \pi r^2$ and $\frac{dS}{dr} = 6 \pi r$ - As $V$ and $S$ are functions of $r$, find $\frac{dV}{dr}$ and $\frac{dS}{dr}$.

Now $\frac{dS}{dt} = \frac{dS}{dr} \times \frac{dr}{dt} = 6 \pi r \times \frac{1}{2 \pi r^2} \times 6$ - Use an extended chain rule together with the property that $\frac{dr}{dt} = \frac{1}{\frac{dV}{dr}}$.

$\frac{dS}{dt} = \frac{18}{r}$

- You can use the following formula for finding approximations

$$\delta y \approx \frac{dy}{dx} \times \delta x$$

This formula shows an approximate relationship between a small change in the variable $x (\delta x)$ and the equivalent small change in the variable $y (\delta y)$.

Example 24

Given $y = 4x^3$ find the approximate percentage change in $y$ for a 1% change in $x$

$$\frac{dy}{dx} = 12x^2$$

First find $\frac{dy}{dx}$.

So $\delta y \approx 12x^2 \times \frac{x}{100}$

$\delta y = \frac{12x^3}{100}$

$\delta x$ is 1% of $x = \frac{x}{100}$.

The percentage change in $y$ will be $\frac{\delta y}{y} \times 100$ - Using the usual definition of percentage change.

Percentage change $= \frac{12x^3}{4x^3 \times 100} \times 100$

$= 3\%$

Exercise 9J

1. Given that $V = \frac{1}{3} \pi r^3$ and that $\frac{dV}{dt} = 8$, find $\frac{dr}{dt}$ when $r = 3$.

2. Given that $A = \frac{1}{4} \pi r^2$ and that $\frac{dr}{dt} = 6$, find $\frac{dA}{dt}$ when $r = 2$. 

3 Given that \( y = xe^x \) and that \( \frac{dy}{dx} = 5 \), find \( \frac{dy}{dt} \) when \( x = 2 \).

4 If \( y = 5x^4 \), find the approximate percentage change in \( y \) due to a change of 0.5% in the value of \( x \).

5 If \( y = 3x^2 \), find the approximate percentage change in \( y \) for a 1% change in \( x \).

6 If the radius of a spherical bubble increases from 1 cm to 1.02 cm, find (to 2 significant figures) the approximate increase in the volume of the bubble.

9.11 You need to be able to apply what you have learned about turning points to solve problems.

**Example 25**

The diagram shows a minor sector OMN of a circle with centre \( O \) and radius \( r \) cm. The perimeter of the sector is 100 cm and the area of the sector is \( A \) cm\(^2\).

a Show that \( A = 50r - r^2 \).

Given that \( r \) varies, find:

b The value of \( r \) for which \( A \) is a maximum and show that \( A \) is a maximum.

c The value of \( \angle MON \) for this maximum area.

d The maximum area of the sector OMN.

a Let the perimeter of the sector be \( P \), so

\[
P = 2r + r\theta
\]

Rearrange and substitute \( P = 100 \) to give

\[
\theta = \frac{100 - 2r}{r}
\]

The area of the sector, \( A = \frac{1}{2}r^2\theta \)

Substitute \( 1 \) in \( 2 \)

\[
A = \frac{1}{2}r^2\left(\frac{100 - 2r}{r}\right)
\]

So \( A = 50r - r^2 \)

b \( \frac{dA}{dr} = 50 - 2r \)

When \( \frac{dA}{dr} = 0, r = 25 \)

Also \( \frac{d^2A}{dr^2} = -2 \), which is negative

So the area is a maximum when \( r = 25 \).
c Substitute \( r = 25 \) into
\[
\theta = \frac{100 - 50}{25} = 2
\]
So angle MON = 2 radians

\[ \text{Answer the final two parts of the question by using the appropriate equations and give the units in your answer.} \]

d The maximum value of the area is
\[
50 \times 25 - 25^2 = 625 \text{ cm}^2
\]
Use \( A = 50r - r^2 \).

---

**Example 26**

A large tank in the shape of a cuboid is to be made from 54 m\(^2\) of sheet metal. The tank has a horizontal base and no top. The height of the tank is \( x \) metres. Two of the opposite vertical faces are squares.

a Show that the volume, \( V \text{ m}^3 \), of the tank is given by \( V = 18x - \frac{2}{3}x^3 \).

b Given that \( x \) can vary, use differentiation to find the maximum or minimum value of \( V \).

c Justify that the value of \( V \) you have found is a maximum.

a Let the length of the tank be \( y \) metres.

\[ \text{Total area. } A = 2x^2 + 3xy \]

So \( 54 = 2x^2 + 3xy \)

\[ y = \frac{54 - 2x^2}{3x} \]

Rearrange to find \( y \) in terms of \( x \).

But \( V = x^2y \)

So \( V = x^2 \left( \frac{54 - 2x^2}{3x} \right) \)

\[ = \frac{x}{3} (54 - 2x^2) \]

So \( V = 18x - \frac{2}{3}x^3 \)

Simplify.

b So \( \frac{dV}{dx} = 18 - 2x^2 \)

Put \( \frac{dV}{dx} = 0 \)

\[ 0 = 18 - 2x^2 \]

So \( x^2 = 9 \)

\[ x = -3 \text{ or } 3 \]

Rearrange to find \( x \).

But \( x \) is a length so \( x = 3 \).
When \( x = 3 \), \( V = 18 \times 3 - \frac{2}{3} \times 3^3 \)

\[ = 54 - 18 
\]

\[ = 36 \]

\( V = 36 \) is a maximum or minimum value of \( V \).

\[ \frac{d^2V}{dx^2} = -4x \]

Find the second derivative of \( V \).

When \( x = 3 \), \( \frac{d^2V}{dx^2} = -4 \times 3 = -12 \)

This is negative, so \( V = 36 \) is the maximum value of \( V \).

**Exercise 9K**

1. A rectangular garden is fenced on three sides, and the house forms the fourth side of the rectangle.
   Given that the total length of the fence is 80 m show that the area, \( A \), of the garden is given by the formula \( A = y(80 - 2y) \), where \( y \) is the distance from the house to the end of the garden.
   Given that the area is a maximum for this length of fence, find the dimensions of the enclosed garden, and the area which is enclosed.

2. A closed cylinder has total surface area equal to 600 \( \pi \). Show that the volume, \( V \) cm\(^3\), of this cylinder is given by the formula \( V = 300\pi - \pi r^3 \), where \( r \) cm is the radius of the cylinder.
   Find the maximum volume of such a cylinder.

3. A sector of a circle has area 100 cm\(^2\). Show that the perimeter of this sector is given by the formula \( P = 2r + \frac{200}{r} \), \( r > \sqrt{\frac{100}{\pi}} \).
   Find the minimum value for the perimeter of such a sector.

4. A shape consists of a rectangular base with a semicircular top, as shown.
   Given that the perimeter of the shape is 40 cm, show that its area, \( A \) cm\(^2\), is given by the formula
   
   \[ A = 40r - 2r^2 - \frac{\pi r^2}{2} \]

   where \( r \) cm is the radius of the semicircle. Find the maximum value for this area.
The shape shown is a wire frame in the form of a large rectangle split by parallel lengths of wire into 12 smaller equal-sized rectangles.

Given that the total length of wire used to complete the whole frame is 1512 mm, show that the area of the whole shape is $A$ mm$^2$, where $A = 1296x - \frac{108x^2}{7}$, where $x$ mm is the width of one of the smaller rectangles.

Find the maximum area which can be enclosed in this way.

**Mixed Exercise 9L**

1. Given that: $y = x^2 + \frac{48}{x}$ ($x > 0$)
   - a. Find the value of $x$ and the value of $y$ when $\frac{dy}{dx} = 0$.
   - b. Show that the value of $y$ which you found in a is a minimum.

2. A curve has equation $y = x^3 - 5x^2 + 7x - 14$. Determine, by calculation, the coordinates of the stationary points of the curve $C$.

3. The function $f$, defined for $x \in \mathbb{R}$, $x > 0$, is such that:
   $$f'(x) = x^2 - 2 + \frac{1}{x^2}$$
   - a. Find the value of $f'(x)$ at $x = 4$.
   - b. Given that $f(3) = 0$, find $f(x)$.
   - c. Prove that $f$ is an increasing function.

4. A curve has equation $y = x^3 - 6x^2 + 9x$.
   Find the coordinates of its maximum turning point.

5. A wire is bent into the plane shape $ABDEA$ as shown. Shape $ABDE$ is a rectangle and $BCD$ is a semicircle with diameter $BD$. The area of the region enclosed by the wire is $R$ m$^2$, $AE = x$ metres, $AB = ED = y$ metres. The total length of the wire is 2 m.
   - a. Find an expression for $y$ in terms of $x$.
   - b. Prove that $R = \frac{x}{8}(8 - 4x - \pi x)$
   - c. Given that $x$ can vary, using calculus and showing your working, find the maximum value of $R$.
   (You do not have to prove that the value you obtain is a maximum.)
6 A cylindrical biscuit tin has a close-fitting lid which overlaps the tin by 1 cm. The radii of the tin and the lid are both \( x \) cm. The tin and the lid are made from a thin sheet of metal of area \( 80\pi \text{cm}^2 \) and there is no wastage. The volume of the tin is \( V \text{cm}^3 \).

a) Show that \( V = \pi(40x - x^2 - x^3) \).

Given that \( x \) can vary:

b) Use differentiation to find the positive value of \( x \) for which \( V \) is stationary.

c) Prove that this value of \( x \) gives a maximum value of \( V \).

d) Find this maximum value of \( V \).

e) Determine the percentage of the sheet metal used in the lid when \( V \) is a maximum.

7 The diagram shows part of the curve with equation \( y = f(x) \), where:

\[
 f(x) = 200 - \frac{250}{x} - x^2, \quad x > 0
\]

The curve cuts the \( x \)-axis at the points \( A \) and \( C \). The point \( B \) is the maximum point of the curve.

a) Find \( f'(x) \).

b) Use your answer to part a to calculate the coordinates of \( B \).

8 The diagram shows the part of the curve with equation \( y = 5 - \frac{1}{2}x^2 \) for which \( y \geq 0 \).

The point \( P(x, y) \) lies on the curve and \( O \) is the origin.

a) Show that \( OP^2 = \frac{1}{4}x^4 - 4x^2 + 25 \).

Taking \( f(x) = \frac{1}{4}x^4 - 4x^2 + 25 \):

b) Find the values of \( x \) for which \( f'(x) = 0 \).

c) Hence, or otherwise, find the minimum distance from \( O \) to the curve, showing that your answer is a minimum.

9 The diagram shows part of the curve with equation \( y = 3 + 5x + x^2 - x^3 \).

The curve touches the \( x \)-axis at \( A \) and crosses the \( x \)-axis at \( C \).

The points \( A \) and \( B \) are stationary points on the curve.

a) Show that \( C \) has coordinates \((3, 0)\).

b) Using calculus and showing all your working, find the coordinates of \( A \) and \( B \).
10 Differentiate with respect to $x$: $x^2 \sin 3x$

11 Given that $2y = x - \sin x \cos x$, show that $\frac{dy}{dx} = \sin^2 x$.

12 Differentiate, with respect to $x$: $\frac{\sin x}{x}$, $x > 0$.

13 Differentiate $e^{2x} \cos x$ with respect to $x$.

The curve $C$ has equation $y = e^{2x} \cos x$.

a Show that the turning points on $C$ occur when $\tan x = 2$.

b Find an equation of the tangent to $C$ at the point where $x = 0$.

14

The figure shows part of the curve $C$ with equation $y = f(x)$, where $f(x) = (x^3 - 2x)e^{-x}$

a Find $f'(x)$.

The normal to $C$ at the origin $O$ intersects $C$ at a point $P$, as shown in the figure.

b Show that the $x$-coordinate of $P$ is the solution of the equation $2x^2 = e^x + 4$.

15 The diagram shows the finite shaded region bounded by the curve with equation $y = x^2 + 3$, the lines $x = 1$, $x = 0$ and the $x$-axis. This region is rotated through $360^\circ$ about the $x$-axis.

Find the volume generated.
Chapter 9: Summary

1 Differentiation
You should know, and be able to use, the following standard formulae.

<table>
<thead>
<tr>
<th>function</th>
<th>derivative</th>
</tr>
</thead>
<tbody>
<tr>
<td>$x^n$</td>
<td>$nx^{n-1}$</td>
</tr>
<tr>
<td>$\sin ax$</td>
<td>$a \cos ax$</td>
</tr>
<tr>
<td>$\cos ax$</td>
<td>$-a \sin ax$</td>
</tr>
<tr>
<td>$e^{ax}$</td>
<td>$ae^{ax}$</td>
</tr>
<tr>
<td>$\frac{f(x)g(x)}{g(x)}$</td>
<td>$\frac{f'(x)g(x) - f(x)g'(x)}{(g(x))^2}$</td>
</tr>
<tr>
<td>$\frac{f'}{g'}$</td>
<td>$f'(x)g(x) + f(x)g'(x)$</td>
</tr>
</tbody>
</table>

2 Integration
You should know, and be able to use, the following standard formulae.

<table>
<thead>
<tr>
<th>function</th>
<th>integral</th>
</tr>
</thead>
<tbody>
<tr>
<td>$x^n$</td>
<td>$\frac{1}{n+1} x^{n+1} + c$ $n \neq -1$</td>
</tr>
<tr>
<td>$\sin ax$</td>
<td>$-\frac{1}{a} \cos ax + c$</td>
</tr>
<tr>
<td>$\cos ax$</td>
<td>$\frac{1}{a} \sin ax + c$</td>
</tr>
<tr>
<td>$e^{ax}$</td>
<td>$\frac{1}{a} e^{ax} + c$</td>
</tr>
</tbody>
</table>

3 Areas and volumes
Area between a curve and $x$-axis = $\int_a^b y \, dx$, $y \geq 0$
Area between a curve and $y$-axis = $\int_c^d x \, dy$, $x \geq 0$
Volume of revolution ($360^\circ$ about $x$-axis) = $\pi \int_a^b y^2 \, dx$
Volume of revolution ($360^\circ$ about $y$-axis) = $\pi \int_c^d x^2 \, dy$

4 A turning point is a point where $\frac{dy}{dx} = 0$

If $\frac{dy}{dx} = 0$ and $\frac{d^2y}{dx^2} > 0$ then the point is a **minimum**.

If $\frac{dy}{dx} = 0$ and $\frac{d^2y}{dx^2} < 0$ then the point is a **maximum**.
Chapter 10: Trigonometry

10.1 You can measure angles in radians.

In your previous International GCSE you worked with angles in degrees, where one degree is \( \frac{1}{360} \)th of a complete revolution. This convention dates back to the Babylonians. It has the advantage that 360 has a great number of factors making division of the circle that much easier, but it is only a convention. Another, and perhaps initially stranger, measure of an angle is the radian.

- If the arc \( AB \) has length \( r \), then \( \angle AOB \) is 1 radian (1° or 1 rad).

\[ A \quad r \quad \angle \quad O \quad B \]

You can put this into words.

- A radian is the angle subtended at the centre of a circle by an arc whose length is equal to that of the radius of the circle.

As an arc of length \( r \) subtends 1 radian at the centre of the circle, it follows that the circumference (an arc of length \( 2\pi r \)) subtends \( 2\pi \) radians at the centre.

As the circumference subtends an angle of \( 360° \) at the centre,

\[ 2\pi \text{ radians} = 360° \]

so \( \pi \) radians = \( 180° \)

It follows that 1 rad = 57.295 ...°.

**Example 1**

Convert the following angles into degrees:

- **a** \( \frac{7\pi}{8} \text{ rad} \)

  \[ \frac{7\pi}{8} \times 180° = \frac{7}{8} \times 180° = 157.5° \]

- **b** \( \frac{4\pi}{15} \text{ rad} \)

  \[ \frac{4\pi}{15} \times 180° = \frac{4\pi}{15} \times 180° = 48° \]

**Hint:**
The symbol for radians is \( \circ \), so \( \theta \circ \) means that \( \theta \) is in radians. If there is no symbol with an angle you should assume that it is in radians, unless the context makes it clear that it is in degrees.
Example 2

Convert the following angles into radians:

a $150^\circ = 150 \times \frac{\pi}{180} \text{ rad} = \frac{5\pi}{6} \text{ rad}$

Since $180^\circ = \pi \text{ rad}$, $1^\circ = \frac{\pi}{180} \text{ rad}$.

b $110^\circ = 110 \times \frac{\pi}{180} \text{ rad} = \frac{11\pi}{18} \text{ rad}$

It is worth remembering that $30^\circ = \frac{\pi}{6} \text{ rad}$.

Your calculator will give the decimal answer 1.919 86...

These answers, in terms of $\pi$, are exact.

Exercise 10A

1 Convert the following angles in radians to degrees:

a $\frac{\pi}{20}$

b $\frac{\pi}{5}$

c $\frac{5\pi}{12}$

d $\frac{\pi}{2}$

e $\frac{7\pi}{9}$

f $\frac{7\pi}{6}$

g $\frac{5\pi}{4}$

h $\frac{3\pi}{2}$

i $3\pi$

2 Use your calculator to convert the following angles to degrees, giving your answer to the nearest 0.1°:

a 0.46°

b 1°

c 1.135°

d $\sqrt{3}$°

e 2.5°

f 3.14°

g 3.49°

3 Use your calculator to write down the value, to 3 significant figures, of the following trigonometric functions.

a $\sin 0.5^\circ$

b $\cos \sqrt{2}^\circ$

c $\tan 1.05^\circ$

d $\sin 2^\circ$

e $\cos 3.6^\circ$

4 Convert the following angles to radians, giving your answers as multiples of $\pi$.

a $8^\circ$

b $10^\circ$

c $22.5^\circ$

d $30^\circ$

e $45^\circ$

f $60^\circ$

g $75^\circ$

h $80^\circ$

i $112.5^\circ$

j $120^\circ$

k $135^\circ$

l $200^\circ$

m $240^\circ$

n $270^\circ$

o $315^\circ$

p $330^\circ$

5 Use your calculator to convert the following angles to radians, giving your answers to 3 significant figures:

a $50^\circ$

b $75^\circ$

c $100^\circ$

d $160^\circ$

e $230^\circ$

f $320^\circ$. 
10.2 The formula for the length of an arc of a circle is simpler when you use radians.

- To find the arc length \( l \) of a circle use the formula \( l = r \theta \), where \( r \) is the radius of the circle and \( \theta \) is the angle, in radians, contained by the sector.

Example 3

Show that the length of an arc is \( l = r \theta \).

The circle has centre \( O \) and radius \( r \).
The arc \( AB \) has length \( l \).

So \( \frac{l}{2\pi r} = \frac{\theta}{2\pi} \)

\[ l = r \theta \]

Length of arc \( \frac{\text{Circumference}}{\text{total angle around } O} \) (both angles are in radians).

Multiply throughout by \( 2\pi r \).
If you know two of \( r, \theta \) and \( l \), the third can be found.

Example 4

Find the length of the arc of a circle of radius 5.2 cm, given that the arc subtends an angle of 0.8 rad at the centre of the circle.

Arc length = 5.2 \times 0.8 \text{ cm} \quad \text{Use } l = r\theta, \text{ with } r = 5.2 \text{ and } \theta = 0.8.

= 4.16 \text{ cm}

Example 5

An arc \( AB \) of a circle, with centre \( O \) and radius \( r \) cm, subtends an angle of \( \theta \) radians at \( O \).
The perimeter of the sector \( AOB \) is \( P \) cm. Express \( r \) in terms of \( \theta \).

\[ P = r\theta + 2r \]
\[ = r(2 + \theta) \]
So \( r = \frac{P}{2 + \theta} \)

Draw a diagram to display the data.

The perimeter = arc \( AB + OA + OB \), where arc \( AB = r\theta \). Factorising.
**Example 6**

The border of a garden pond consists a straight edge $AB$ of length 2.4 m, and a curved part $C$, as shown in the diagram below. The curved part is an arc of a circle, centre $O$ and radius 2 m. Find the length of $C$.

C subtends the reflex angle $\theta$ at $O$. so length of $C = 2\theta$.

You can use the isosceles triangle $AOB$ to find the angle $AOB$ inside the triangle. (Use your calculator in radian mode.)

$$\sin x = \frac{1.2}{2}$$
$$x = 0.6435 \text{ rad}$$

Acute $\angle AOB = 2x \text{ rad}$
$$= 2(0.6435)$$
$$= 1.287 \text{ rad}$$

So $\theta = (2\pi - 1.287) \text{ rad}$
$$= 4.996 \text{ rad}$$

So length of $C = 9.99 \text{ m (3 s.f.)}$

$C = 2\theta$

---

**Exercise 10B**

1. An arc $AB$ of a circle, centre $O$ and radius $r$ cm, subtends an angle $\theta$ radians at $O$.
   The length of $AB$ is $l$ cm.
   
   - **a** Find $l$ when
     - i $r = 6, \theta = 0.45$
     - ii $r = 4.5, \theta = 0.45$
     - iii $r = 20, \theta = \frac{3}{8}\pi$
   
   - **b** Find $r$ when
     - i $l = 10, \theta = 0.6$
     - ii $l = 1.26, \theta = 0.7$
     - iii $l = 1.5\pi, \theta = \frac{5}{12}\pi$
   
   - **c** Find $\theta$ when
     - i $l = 10, r = 7.5$
     - ii $l = 4.5, r = 5.625$
     - iii $l = \sqrt{12}, r = \sqrt{3}$

2. A minor arc $AB$ of a circle, centre $O$ and radius 10 cm, subtends an angle $x$ at $O$.
   The major arc $AB$ subtends an angle $5x$ at $O$. Find, in terms of $\pi$, the length of the minor arc $AB$.

3. An arc $AB$ of a circle, centre $O$ and radius 6 cm, has length $l$ cm. Given that the chord $AB$ has length 6 cm, find the value of $l$, giving your answer in terms of $\pi$. 
4. The sector of a circle of radius \(\sqrt{10}\) cm contains an angle of \(\sqrt{5}\) radians, as shown in the diagram. Find the length of the arc, giving your answer in the form \(\frac{p}{\sqrt{q}}\) cm, where \(p\) and \(q\) are integers.

5. Referring to the diagram, find:
   a. The perimeter of the shaded region when \(\theta = 0.8\) radians.
   b. The value of \(\theta\) when the perimeter of the shaded region is 14 cm.

6. A sector of a circle of radius \(r\) cm contains an angle of 1.2 radians. Given that the sector has the same perimeter as a square of area 36 cm\(^2\), find the value of \(r\).

7. A sector of a circle of radius 15 cm contains an angle of \(\theta\) radians. Given that the perimeter of the sector is 42 cm, find the value of \(\theta\).

8. In the diagram \(AB\) is the diameter of a circle, centre \(O\) and radius 2 cm. The point \(C\) is on the circumference such that \(\angle COB = \frac{4}{3}\pi\) radians.

   a. State the value, in radians, of \(\angle COA\).

   The shaded region enclosed by the chord \(AC\), arc \(CB\) and \(AB\) is the template for a brooch.

   b. Find the exact value of the perimeter of the brooch.

9. The points \(A\) and \(B\) lie on the circumference of a circle with centre \(O\) and radius 8.5 cm. The point \(C\) lies on the major arc \(AB\). Given that \(\angle ACB = 0.4\) radians, calculate the length of the minor arc \(AB\).

10. In the diagram \(OAB\) is a sector of a circle, centre \(O\) and radius \(R\) cm, and \(\angle AOB = 2\theta\) radians. A circle, centre \(C\) and radius \(r\) cm, touches the arc \(AB\) at \(T\), and touches \(OA\) and \(OB\) at \(D\) and \(E\) respectively, as shown.

    a. Write down, in terms of \(R\) and \(r\), the length of \(OC\).

    b. Using \(\triangle OCE\), show that \(R \sin \theta = r (1 + \sin \theta)\).

    c. Given that \(\sin \theta = \frac{3}{4}\) and that the perimeter of the sector \(OAB\) is 21 cm, find \(r\), giving your answer to 3 significant figures.
10.3 The formula for the area of a sector of a circle is simpler when you use radians.

- To find the area $A$ of a sector of a circle use the formula $A = \frac{1}{2}r^2\theta$, where $r$ is the radius of the circle and $\theta$ is the angle, in radians, contained by the sector.

Example 7

Show that the area of the sector of a circle with radius $r$ is $A = \frac{1}{2}r^2\theta$.

The circle has centre $O$ and radius $r$.

The sector $POQ$ has area $A$.

So $\frac{A}{\pi r^2} = \frac{\theta}{2\pi}$

The area of sector $\frac{\text{area of sector}}{\text{area of circle}} = \frac{\text{angle POQ}}{\text{total angle around O}}$

$A = \frac{1}{2}r^2\theta$

Multiply throughout by $\pi r^2$.

If you know two of $r$, $\theta$ and $A$, the third can be found.

Example 8

In the diagram, the area of the minor sector $AOB$ is $28.9 \text{ cm}^2$.

Given that $\angle AOB = 0.8$ radians, calculate the value of $r$.

Let area of sector be $A \text{ cm}^2$, and use $A = \frac{1}{2}r^2\theta$.

Find $r^2$ and then take the square root.

$28.9 = \frac{1}{2}r^2(0.8) = 0.4r^2$

So $r^2 = \frac{28.9}{0.4} = 72.25$

$r = 8.5$
Example 9

A plot of land is in the shape of a sector of a circle of radius 55 m. The length of fencing that is erected along the edge of the plot to enclose the land is 176 m. Calculate the area of the plot of land.

Draw a diagram to include all the data and let the angle of the sector be $\theta$.

$\text{Arc } AB = 176 - (55 + 55)$
$= 66 \text{ m}$
$66 = 55\theta$

So $\theta = 1.2 \text{ radians}$

As the perimeter is given, first find length of arc $AB$.

Use the formula for arc length, $l = r\theta$.

Area of plot $= \frac{1}{2}(55)^2(1.2)$
$= 1815 \text{ m}^2$

Use the formula for area of a sector, $A = \frac{1}{2}r^2\theta$.

Exercise 10C

(Note: give non-exact answers to 3 significant figures.)

1. Find the area of the shaded sector in each of the following circles with centre $C$. Leave your answer in terms of $\pi$, where appropriate.

a)

b)

c)

d)

e)

f)
2 For the following circles with centre C, the area $A$ of the shaded sector is given. Find the value of $x$ in each case.

a \[ A = 12 \text{ cm}^2 \]

b \[ A = 15\pi \text{ cm}^2 \]

c \[ A = 20 \text{ cm}^2 \]

3 The arc $AB$ of a circle, centre $O$ and radius $6 \text{ cm}$, has length $4 \text{ cm}$. Find the area of the minor sector $AOB$.

4 The chord $AB$ of a circle, centre $O$ and radius $10 \text{ cm}$, has length $18.65 \text{ cm}$ and subtends an angle of $\theta$ radians at $O$.

a Show that $\theta = 2.40$ (to 3 significant figures).

b Find the area of the minor sector $AOB$.

5 The area of a sector of a circle of radius $12 \text{ cm}$ is $100 \text{ cm}^2$. Find the perimeter of the sector.

6 The arc $AB$ of a circle, centre $O$ and radius $r \text{ cm}$, is such that $\angle AOB = 0.5 \text{ radians}$. Given that the perimeter of the minor sector $AOB$ is $30 \text{ cm}$:

a Calculate the value of $r$.

b Show that the area of the minor sector $AOB$ is $36 \text{ cm}^2$.

c Calculate the area of the segment enclosed by the chord $AB$ and the minor arc $AB$.

7 In the diagram, $AB$ and $AC$ are tangents to a circle, centre $O$ and radius $3.6 \text{ cm}$. Calculate the area of the shaded region, given that $\angle BOC = \frac{2}{3}\pi \text{ radians}$.

8 A chord $AB$ subtends an angle of $\theta$ radians at the centre $O$ of a circle of radius $6.5 \text{ cm}$. Find the area of the segment enclosed by the chord $AB$ and the minor arc $AB$, when:

a $\theta = 0.8$

b $\theta = \frac{2}{3}\pi$

c $\theta = \frac{4}{3}\pi$
9 An arc $AB$ subtends an angle of 0.25 radians at the circumference of a circle, centre $O$ and radius 6 cm. Calculate the area of the minor sector $OAB$.

10 In the diagram, $AD$ and $BC$ are arcs of circles with centre $O$, such that $OA = OD = r$ cm. $AB = DC = 8$ cm and $\angle BOC = \theta$ radians.

a Given that the area of the shaded region is $48$ cm$^2$, show that $r = \frac{6}{\theta} - 4$.

b Given also that $r = 10\theta$, calculate the perimeter of the shaded region.

11 A sector of a circle of radius 28 cm has perimeter $P$ cm and area $A$ cm$^2$. Given that $A = 4P$, find the value of $P$.

12 The diagram shows a triangular plot of land. The sides $AB$, $BC$ and $CA$ have lengths 12 m, 14 m and 10 m respectively. The lawn is a sector of a circle, centre $A$ and radius 6 m.

a Show that $\angle BAC = 1.37$ radians, correct to 3 significant figures.

b Calculate the area of the flowerbed.

**10.4** You can use $\sin x$, $\cos x$ and $\tan x$ for angles of any magnitude.

You should be familiar with the shapes of the graphs of the basic trigonometric functions and some of their properties.

$y = \sin \theta$
**Functions that repeat themselves after a certain interval are called periodic functions, and the interval is called the period of the function. You can see that \( \sin \theta \) is periodic with a period of \( 360^\circ \).

There are many symmetry properties of \( \sin \theta \) but you can see from the graph that:

\[
\sin (\theta + 360^\circ) = \sin \theta \quad \text{and} \quad \sin (\theta - 360^\circ) = \sin \theta
\]

\[
\sin (90^\circ - \theta) = \sin (90^\circ + \theta)
\]

**\( y = \cos \theta \)**

Like \( \sin \theta \), \( \cos \theta \) is periodic with a period of \( 360^\circ \). In fact, the graph of \( \cos \theta \) is the same as that of \( \sin \theta \) when it has been translated by \( 90^\circ \) to the left.

Two further symmetry properties of \( \cos \theta \) are:

\[
\cos (\theta + 360^\circ) = \cos \theta \quad \text{and} \quad \cos (\theta - 360^\circ) = \cos \theta
\]

\[
\cos (-\theta) = \cos \theta
\]

**\( y = \tan \theta \)**

This function behaves very differently from the sine and cosine functions but it is still periodic, it repeats itself in cycles of \( 180^\circ \) so its period is \( 180^\circ \).

The period symmetry properties of \( \tan \theta \) are:

\[
\tan (\theta + 180^\circ) = \tan \theta
\]

\[
\tan (\theta - 180^\circ) = \tan \theta
\]

**Hints:**

- The graph of \( \sin \theta \), where \( \theta \) is in radians, has period \( 2\pi \).
- Because it is periodic.
- Symmetry about \( \theta = 90^\circ \).

- Because it is periodic.
- Symmetry about \( \theta = 0^\circ \).

**Hints:**

The dotted lines on the graph are called asymptotes, lines to which the curve approaches but never reaches; these occur at \( \theta = (2n + 1)90^\circ \) where \( n \) is an integer.
You can find the trigonometrical ratios of angles 30°, 45° and 60° exactly.

Consider an equilateral triangle ABC of side 2 units.

If you drop a perpendicular from A to meet BC at D, then 
$BD = DC = 1$ unit. \( \angle BAD = 30° \) and \( \angle ABD = 60° \).

Using Pythagoras' theorem in \( \triangle ABD \)
\[ AD^2 = 2^2 - 1^2 = 3 \]
So \( AD = \sqrt{3} \) units

Using \( \triangle ABD \), \( \sin 30° = \frac{1}{2}, \cos 30° = \frac{\sqrt{3}}{2}, \tan 30° = \frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3} \),
and \( \sin 60° = \frac{\sqrt{3}}{2}, \cos 60° = \frac{1}{2}, \tan 60° = \sqrt{3} \).

If you now consider an isosceles right-angled triangle PQR, in which \( PQ = QR = 1 \) unit, then the ratios for 45° can be found.

Using Pythagoras' theorem
\[ PR^2 = 1^2 + 1^2 = 2 \]
So \( PR = \sqrt{2} \) units

Then \( \sin 45° = \cos 45° = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2} \) and \( \tan 45° = 1 \)

---

**Example 10**

Find the exact values of 

a \( \cos 405° \)  

b \( \tan 120° \)  

c \( \sin 300° \)

---

a \( \cos 405° = \cos (360° + 45) \)  
\[ = \cos (45) \]
\[ = \frac{1}{\sqrt{2}} \]  

This can be seen from the graph, using the fact that \( \cos x \) has a period of 360°.

Using the above triangle \( PRQ \).

b \( \tan 120° = \tan (180° - 60) \)  
\[ = \tan (-60) \]
\[ = -\tan(60) \]
\[ = -\sqrt{3} \]  

This can be seen from the graph, using the fact that \( \tan x \) has a period of 180°.

Using the above triangle \( ABD \).

c \( \sin 300° = \sin (360° - 60) \)  
\[ = \sin (-60) \]
\[ = -\sin(60) \]
\[ = -\frac{\sqrt{3}}{2} \]  

See the graph, using the fact that the period of \( \sin x \) is 360°. Then use triangle \( ABD \).
Exercise 10D

1. Express the following as trigonometric ratios of either 30°, 45° or 60°, and hence find their exact values.

   a. \( \sin 135° \)
   b. \( \sin (-60°) \)
   c. \( \sin 330° \)
   d. \( \sin 420° \)
   e. \( \sin (-300°) \)
   f. \( \cos 120° \)
   g. \( \cos 300° \)
   h. \( \cos 225° \)
   i. \( \cos (-210°) \)
   j. \( \cos 495° \)
   k. \( \tan 135° \)
   l. \( \tan (-225°) \)
   m. \( \tan 210° \)
   n. \( \tan 300° \)
   o. \( \tan (-120°) \)

10.5 You can use the sine and cosine rules.

You should have met these rules in your previous International GCSE.

- **sine rule** is \( \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \)
- **cosine rule** is \( a^2 = b^2 + c^2 - 2bc \cos A \)
- **area of a triangle** is \( \frac{1}{2}ab \sin C \)

**Hint:**
Note that side \( a \) is opposite angle \( A \).

Example 11

In \( \triangle ABC \), \( AB = 8 \text{ cm} \), \( \angle BAC = 30° \) and \( \angle BCA = 40° \). Find \( BC \).

Always draw a diagram and carefully add the data. Here \( c = 8 \text{ cm}, \) \( C = 40° \), \( A = 30° \), \( a = x \text{ cm} \)

In a triangle, the larger an angle is, the larger the opposite side is. Here, as \( C > A \), then \( c > a \), so you know that \( 8 > x \).

\[
\frac{x}{\sin 30°} = \frac{8}{\sin 40°} \quad \text{Using the sine rule, } \frac{a}{\sin A} = \frac{c}{\sin C}.
\]

So \( x = \frac{8 \sin 30°}{\sin 40°} \) Multiply throughout by \( \sin 30° \).

\[ = 6.22 \quad \text{Give answer to 3 significant figures.} \]
**Example 12**

In $\triangle ABC$, $AB = 4\,\text{cm}$, $AC = 12\,\text{cm}$ and $\angle ABC = 64^\circ$. Find $\angle ACB$.

\[ \sin C = \frac{\sin 64^\circ}{12} \]

So

\[ \sin C = \frac{4 \sin 64^\circ}{12} \]

\[ C = 17.4^\circ \]

Here $b = 12\,\text{cm}$, $c = 4\,\text{cm}$, $B = 64^\circ$.

As you need to find angle $C$, use the sine rule $\frac{\sin C}{c} = \frac{\sin B}{b}$.

As $4 < 12$, you know that $C < 64^\circ$.

\[ C = \sin^{-1} \left( \frac{4 \sin 64^\circ}{12} \right) \]

Sometimes the sine rule will lead to two possible values for an angle.

**Example 13**

In $\triangle ABC$, $AB = 4\,\text{cm}$, $AC = 3\,\text{cm}$ and $\angle ABC = 44^\circ$. Work out the two possible values of $\angle ACB$.

\[ \sin C = \frac{\sin 44^\circ}{3} \]

\[ \sin C = \frac{4 \sin 44^\circ}{3} \]

So $C = 67.9^\circ$.

Or $C = 112^\circ$ (3 s.f.)

Here $\angle ACB > \angle ABC$, as $AB > AC$, and so there will be two possible results. The diagram shows why.

With $\angle ABC = 44^\circ$ and $AB = 4\,\text{cm}$ drawn, imagine putting a pair of compasses at $A$, then drawing an arc with centre $A$ and radius $3\,\text{cm}$. This will intersect $BC$ at $C_1$ and $C_2$ showing that there are two triangles $ABC_1$ and $ABC_2$ where $b = 3\,\text{cm}$, $c = 4\,\text{cm}$ and $B = 44^\circ$.

(This would not happen if $AC > 4\,\text{cm}$.)

Use $\sin C = \frac{\sin B}{b}$, where $b = 3$, $c = 4$, $B = 44^\circ$.

This is the value your calculator will give to 3 s.f., which corresponds to $\triangle ABC_2$.

As $\sin (180 - x)^\circ = \sin x^\circ$, $C = 180 - 67.9^\circ = 112.1^\circ$ is another possible answer. This corresponds to $\triangle ABC_1$. 

169
You can rearrange the cosine rule formula to help you find an angle.

Rearrange the equation \( a^2 = b^2 + c^2 - 2bc \cos A \) in the form \( \cos A = \ldots \)

\[
a^2 = b^2 + c^2 - 2bc \cos A
\]

So \( 2bc \cos A = b^2 + c^2 - a^2 \)

So \( \cos A = \frac{b^2 + c^2 - a^2}{2bc} \) Divide throughout by \( 2bc \).

**Example 14**

In \( \triangle PQR \), \( PQ = 5.9 \text{ cm} \), \( QR = 8.2 \text{ cm} \) and \( PR = 10.6 \text{ cm} \).

Calculate the size of \( \angle PQR \).

\[
\cos Q = \frac{8.2^2 + 5.9^2 - 10.6^2}{2 \times 8.2 \times 5.9}
\]

\[
= -0.1065...
\]

\( Q = 96.1^\circ \)

\( \angle PQR = 96.1^\circ \)

**Example 15**

In \( \triangle ABC \), \( AB = 5 \text{ cm} \), \( BC = 6 \text{ cm} \) and \( \angle ABC = x^\circ \). Given that the area of \( \triangle ABC \) is \( 12 \text{ cm}^2 \) and that \( AC \) is the longest side, find the value of \( x \).

\[
\text{Area } \triangle ABC = \frac{1}{2} \times 5 \times 6 \times \sin x^\circ \text{ cm}^2
\]

So \( 12 = \frac{1}{2} \times 5 \times 6 \times \sin x^\circ \)

So \( \sin x^\circ = 0.8\)

\( x = 126.9^\circ \)

\( = 127 \text{ (3 s.f.)} \)

Here \( a = 6 \text{ cm} \), \( c = 5 \text{ cm} \) and angle \( B = x^\circ \), so use:

\( \text{Area } = \frac{1}{2}ac \sin B \).

\( \text{Area of } \triangle ABC \text{ is } 12 \text{ cm}^2 \).

\( \sin x^\circ = \frac{12}{15} \)

There are two values of \( x \) for which \( \sin x^\circ = 0.8 \), 53.1 and 126.9, but here you know \( B \) is the largest angle because \( AC \) is the largest side.
Exercise 10E

1 In each of the following triangles calculate the values of $x$ and $y$.

a

$$\begin{array}{c}
\text{7.5 cm} \\
\text{57°} \\
\text{x cm} \\
\text{y cm} \\
\text{39°}
\end{array}$$

b

$$\begin{array}{c}
\text{25 cm} \\
\text{112°} \\
\text{x cm} \\
\text{30°} \\
\text{y cm}
\end{array}$$

c

$$\begin{array}{c}
\text{8 cm} \\
\text{60°} \\
\text{x cm} \\
\text{145°} \\
\text{y cm}
\end{array}$$

d

$$\begin{array}{c}
\text{8 cm} \\
\text{50°} \\
\text{x cm} \\
\text{y cm}
\end{array}$$

e

$$\begin{array}{c}
\text{5.9 cm} \\
\text{x cm} \\
\text{72°} \\
\text{56.4°} \\
\text{y cm}
\end{array}$$

f

$$\begin{array}{c}
\text{6 cm} \\
\text{36.8°} \\
\text{x cm} \\
\text{53.2°} \\
\text{y cm}
\end{array}$$

2 In each of the diagrams shown below, work out the value of $x$:

a

$$\begin{array}{c}
\text{7.2 cm} \\
\text{5.8 cm} \\
\text{67.5°} \\
\text{A} \\
\text{B} \\
\text{C} \\
\text{x cm}
\end{array}$$

b

$$\begin{array}{c}
\text{6.2 cm} \\
\text{4.5 cm} \\
\text{80°} \\
\text{A} \\
\text{B} \\
\text{C} \\
\text{x cm}
\end{array}$$

c

$$\begin{array}{c}
\text{3\sqrt{2} cm} \\
\text{\sqrt{2} cm} \\
\text{50°} \\
\text{A} \\
\text{B} \\
\text{C} \\
\text{x cm}
\end{array}$$

d

$$\begin{array}{c}
\text{10 cm} \\
\text{8 cm} \\
\text{70°} \\
\text{A} \\
\text{B} \\
\text{C} \\
\text{x cm}
\end{array}$$

e

$$\begin{array}{c}
\text{7.9 cm} \\
\text{55°} \\
\text{A} \\
\text{B} \\
\text{C} \\
\text{x cm}
\end{array}$$

f

$$\begin{array}{c}
\text{12.4 cm} \\
\text{9.7 cm} \\
\text{60°} \\
\text{A} \\
\text{B} \\
\text{C} \\
\text{x cm}
\end{array}$$
3. In each of the diagrams shown below, calculate the possible values of $x$ and the corresponding values of $y$:

(a) \[ \triangle ABC \] with $A = 40^\circ$, $B = 8\text{ cm}$, $C = 12\text{ cm}$

(b) \[ \triangle BCD \] with $B = 25.6^\circ$, $C = 21\text{ cm}$, $D = ?\text{ cm}$

(c) \[ \triangle ABD \] with $A = 50^\circ$, $B = 4\text{ cm}$, $D = ?\text{ cm}$

4. In each of the following triangles calculate the length of the third side:

(a) \[ \triangle ABC \] with $A = 20^\circ$, $B = 6.5\text{ cm}$, $C = 8.4\text{ cm}$

(b) \[ \triangle BCD \] with $B = 60^\circ$, $C = 1\text{ cm}$, $D = ?\text{ cm}$

(c) \[ \triangle ABD \] with $A = 160^\circ$, $B = 4.5\text{ cm}$, $D = 5.5\text{ cm}$

(d) \[ \triangle ABC \] with $A = 45^\circ$, $B = 5\text{ cm}$, $C = 6\text{ cm}$

(e) \[ \triangle BCD \] with $B = 40^\circ$, $C = 10\text{ cm}$, $D = 10\text{ cm}$

(f) \[ \triangle ABD \] with $A = 108^\circ$, $B = 5.6\text{ cm}$, $D = 6.5\text{ cm}$

5. In the following triangles calculate the size of the angle marked $*$:

(a) \[ \triangle ABC \] with $A = 4\text{ cm}$, $B = 8\text{ cm}$, $C = 10\text{ cm}$

(b) \[ \triangle BCD \] with $A = 25\text{ cm}$, $B = 24\text{ cm}$, $C = 7\text{ cm}$

(c) \[ \triangle ABC \] with $A = 4\text{ cm}$, $B = 3.5\text{ cm}$, $C = 2.5\text{ cm}$

(d) \[ \triangle BCD \] with $A = 10\text{ cm}$, $B = 7\text{ cm}$, $C = 8\text{ cm}$

(e) \[ \triangle ABC \] with $A = 9\text{ cm}$, $B = 14\text{ cm}$, $C = 6\text{ cm}$

(f) \[ \triangle ABD \] with $A = 6.2\text{ cm}$, $B = 6.2\text{ cm}$, $D = 3.8\text{ cm}$
6. Calculate the area of the following triangles:

a. \[ \text{8.6 cm} \quad \text{B} \quad \text{C} \quad \text{7.8 cm} \]
   \[ \text{45°} \]

b. \[ \text{3.5 cm} \quad \text{B} \quad \text{C} \quad \text{2.5 cm} \]
   \[ \text{100°} \]

c. \[ \text{6.4 cm} \quad \text{B} \quad \text{C} \quad \text{6.4 cm} \]
   \[ \text{80°} \]

7. The area of a triangle is 10 cm². The angle between two of the sides, of length 6 cm and 8 cm respectively, is obtuse. Work out:
   a. The size of this angle.
   b. The length of the third side.

8. In each triangle below, find the value of \( x \) and the area of the triangle:

a. \[ \text{2.4 cm} \quad \text{1.2 cm} \quad \text{3 cm} \]
   \[ x^\circ \]

b. \[ \text{6 cm} \quad \text{5 cm} \quad \text{3 cm} \]
   \[ x^\circ \]
   \[ \text{80°} \]

c. \[ \text{5 cm} \quad \text{5 cm} \quad \text{3 cm} \]
   \[ x^\circ \]
   \[ \text{40°} \]

9. The sides of a triangle are 3 cm, 5 cm and 7 cm respectively. Show that the largest angle is 120°, and find the area of the triangle.

10. In each of the figures below calculate the total area:

a. \[ \text{A} \quad \text{B} \quad \text{10.4 cm} \quad \text{C} \]
   \[ \text{8.2 cm} \quad \text{D} \quad \text{30.6°} \]
   \[ \text{100°} \]

b. \[ \text{A} \quad \text{B} \quad \text{3.9 cm} \quad \text{4.8 cm} \quad \text{C} \]
   \[ \text{3.9 cm} \quad \text{75°} \]
   \[ D \quad \text{2.4 cm} \]
Example 16

$ABCDEFGH$ is a rectangular box.

Find to 3 significant figures:

- **a** length $EG$
- **b** length $CE$
- **c** the angle $CE$ makes with plane $EFGH$ (angle $CEG$).

**a** Draw triangle $EGH$ in 2D.

![Diagram of triangle EGH]

Pythagoras' Theorem

$EG^2 = 3^2 + 10^2$

$= 109$

$EG = \sqrt{109}$

$EG = 10.4$ cm (3 s.f.)

**b** Draw triangle $CEG$ in 2D.

![Diagram of triangle CEG]

Pythagoras' Theorem

$CE^2 = 5^2 + 109$

$= 134$

$CE = \sqrt{134}$

$CE = 11.6$ cm (3 s.f.)

**c** Let angle $CEG = \theta$

$\tan \theta = \frac{5}{\sqrt{109}} \Rightarrow \theta = \text{angle } CEG = 25.6^\circ$ (3 s.f.)

Sometimes you may be asked to find the angle between two planes. To do this you need to do the following:

- **i** identify the line of intersection of the two planes
- **ii** find a point $X$ on this line and points $A$ and $B$ on the two planes so that $AX$ and $BX$ are both perpendicular to the line
- **iii** find the angle $AXB$ which is the angle between the two planes.
Example 17

VWXYZ is a solid regular pyramid on a rectangular base WXYZ where WX = 8 cm and XY = 6 cm. The vertex of the pyramid V is 12 cm directly above the centre of the base.

Find:

a  VX
b  the angle between VX and the base WXYZ
   (angle VXZ)
c  the area of pyramid face VWX.
d  the angle between the plane VWX and the plane WXYZ.

a  Let M be the mid-point ZX.
   Draw WXYZ in 2D.
   Pythagoras' Theorem on triangle ZWX:
   \[ ZX^2 = 6^2 + 8^2 \]
   \[ = 100 \]
   \[ ZX = 10 \text{ cm} \Rightarrow MX = 5 \text{ cm} \]
   Draw triangle VMX in 2D.
   Pythagoras' Theorem on triangle VMX:
   \[ VX^2 = 5^2 + 12^2 \]
   \[ = 169 \]
   \[ VX = 13 \text{ cm} \]

b  Angle VXZ = Angle VXM = \( \theta \)
   \[ \tan \theta = \frac{12}{5} \Rightarrow \theta = 67.4^\circ \text{ (3 s.f.)} \]
   \[ \Rightarrow \text{Angle VXZ} = 67.4^\circ \text{ (3 s.f.)} \]

c  Let N be the mid-point of WX.
   Area of triangle VWX = \( \frac{1}{2} \times \text{base} \times \text{perpendicular height} \)
   \[ = \frac{1}{2} \times WX \times VN \]
   \[ = \frac{1}{2} \times 8 \times VN \]
   Draw triangle VNX in 2D.
   Pythagoras' Theorem on triangle VNX:
   \[ 13^2 = 4^2 + VN^2 \]
   \[ VN^2 = 13^2 - 4^2 \]
   \[ = 153 \]
   \[ VN = \sqrt{153} \Rightarrow \text{Area of VWX} = \frac{1}{2} \times 8 \times \sqrt{153} \]
   \[ = 49.5 \text{ cm}^2 \text{ (3 s.f.)} \]
d The line of intersection of the two planes is WX.

If N is the midpoint of WX and L is the midpoint of YZ then VN is perpendicular to WX (since VWX is an isosceles triangle) and NL is perpendicular to WX.

The required angle VNL is a base angle of an isosceles triangle and we can use triangle VNM to find it.

\[ \tan(VNM) = \frac{12}{3} = 4 \]

so the angle between the planes is \( \arctan(4) = 75.96\ldots \) = 76° (nearest degree)

---

**Exercise 10F**

Give all answers to 3 significant figures.

1. **ABCD\(EFGH\) is a rectangular box.**
   
   Find:
   
   a. \(EG\)
   
   b. \(AG\)
   
   c. the angle between \(AG\) and plane \(EFGH\) (angle \(AGE\))
   
   d. the angle between the plane \(DCFE\) and the plane \(EFGH\).

2. **STUVWXYZ is a rectangular box.**
   
   Find:
   
   a. \(SU\)
   
   b. \(SY\)
   
   c. the angle between \(SY\) and plane \(STUV\) (angle \(YSU\))
   
   d. the angle between the plane \(TUZW\) and the plane \(VSWZ\).
3. \( LMNOPQRS \) is a cube of side 10 cm.
Find:
- a) \( PR \)
- b) \( LR \)
- c) the angle between \( LR \) and plane \( PQRS \) (angle \( LRP \)).

4. \( ABCDEFGH \) is a cube of side 20 cm.
Find:
- a) \( CF \)
- b) \( DF \)
- c) the angle between \( DF \) and plane \( BCGF \) (angle \( DFC \))
- d) the angle \( MHA \), if \( M \) is the mid-point of \( AB \).

5. \( ABCDEF \) is a small ramp where \( ABCD \) and \( CDEF \) are both rectangles and perpendicular to each other.
Find:
- a) \( AC \)
- b) \( AF \)
- c) angle \( FAB \)
- d) the angle between \( AF \) and plane \( ABCD \) (angle \( FAC \)).
- e) the angle between the plane \( ABFE \) and the plane \( ABCD \).

6. \( PQRSTU \) is an artificial ski-slope where \( PQRS \) and \( RSTU \) are both rectangles and perpendicular to each other.
Find:
- a) \( UP \)
- b) \( PR \)
- c) the angle between \( UP \) and plane \( PQRS \) (angle \( UPR \))
- d) the angle between \( MP \) and plane \( PQRS \), if \( M \) is the mid-point of \( TU \).
- e) the angle between the plane \( RSTU \) and the plane \( PQUT \).

7. \( ABCD \) is a solid on a horizontal triangular base
\( ABC \). Edge \( AD \) is 25 cm and vertical. \( AB \) is perpendicular to \( AC \). Angles \( ABD \) and \( ACD \) are equal to 30° and 20° respectively.
Find:
- a) \( AB \)
- b) \( AC \)
- c) \( BC \).
8 PQRS is a solid on a horizontal triangular base PQR. S is vertically above P. Edges PQ and PR are 50 cm and 70 cm respectively. PQ is perpendicular to PR. Angle SQP is 30°. Find:
  a  SP
  b  RS
  c  angle PRS.

9 PABCD is a solid regular pyramid on a rectangular base ABCD where AB = 10 cm and BC = 7 cm. The vertex of the pyramid, P, is 15 cm directly above the centre of the base. Find:
  a  PA
  b  the angle between PA and base ABCD (angle PAC)
  c  the area of pyramid face PBC.
  d  the angle between the plane ABCD and the plane PBC.

10 PQRST is a solid regular pyramid on a square base QRST where QR = 20 cm and edge PQ = 30 cm. Find:
  a  the height of P above base QRST
  b  the angle PS makes with the base QRST
  c  the total external area of the pyramid including the base.

11 STUVWXYZ is a rectangular box. M and N are the mid-points of ST and WZ respectively. Find angle:
  a  SYW
  b  TNX
  c  ZMY.

12 ABCDEFGH is a solid cube of volume 1728 cm³. P and Q are the mid-points of FG and GH respectively. Find:
  a  angle QCP
  b  the total surface area of the solid remaining after pyramid PGQC is cut off.
13 A church is made from two solid rectangular blocks with a regular pyramidal roof above the tower, with \( V \) being 40 m above ground level. Find:
\[ \begin{align*}
\text{a} & \quad VA \\
\text{b} & \quad \text{the angle of elevation of} \ V \ \text{from} \ E \\
\text{c} & \quad \text{the cost of tiling the tower roof if the church is charged} \ 2.50/\text{m}^2
\end{align*} \]

A hemispherical lampshade of diameter 40 cm is hung from a point by four chains, each of length 50 cm. If the chains are equally spaced on the rim of the hemisphere, find:
\[ \begin{align*}
\text{a} & \quad \text{the angle each chain makes with the horizontal} \\
\text{b} & \quad \text{the angle between two adjacent chains}
\end{align*} \]

15 The angle of elevation to the top of a church tower is measured from \( A \) and from \( B \)
From \( A \), due South of the church tower \( VC \), the angle of elevation \( \angle VAC = 15^\circ \).
From \( B \), due East of the church, the angle of elevation \( \angle VBC = 25^\circ \).
\( AB = 200 \) m.
Find the height of the tower.

16 An aircraft is flying at a constant height of 2000 m. It is flying due East at a constant speed. At \( T \), the plane's angle of elevation from \( O \) is 25°, and on a bearing from \( O \) of 310°. One minute later, it is at \( R \) and due North of \( O \).
\( RSWT \) is a rectangle and the points \( O, W \) and \( S \) are on horizontal ground.
Find:
\[ \begin{align*}
\text{a} & \quad \text{the lengths} \ OW \ \text{and} \ OS \\
\text{b} & \quad \text{the angle of elevation of the aircraft,} \ \angle ROS \\
\text{c} & \quad \text{the speed of the aircraft in} \ \text{km/h}
\end{align*} \]
10.7 You can use trigonometric identities and formulae to simplify expressions.

You should know the following identity

- $\cos^2 \theta + \sin^2 \theta = 1$

The following formulae will be provided if required:

- $\tan \theta = \frac{\sin \theta}{\cos \theta}$
- $\sin(A + B) = \sin A \cos B + \cos A \sin B$
- $\cos(A + B) = \cos A \cos B - \sin A \sin B$
- $\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}$

Example 18

Simplify the following expressions:

- a $\sin^2 3\theta + \cos^2 3\theta$
- b $5 - 5 \sin^2 \theta$
- c $\frac{\sin 2\theta}{\sqrt{1 - \sin^2 2\theta}}$

a $\sin^2 3\theta + \cos^2 3\theta = 1$  \quad $\sin^2 \theta + \cos^2 \theta = 1$, with $\theta$ replaced by $3\theta$.

b $5 - 5 \sin^2 \theta = 5(1 - \sin^2 \theta) = 5 \cos^2 \theta$  \quad $\sin^2 \theta + \cos^2 \theta = 1$, so $1 - \sin^2 \theta = \cos^2 \theta$.

c $\frac{\sin 2\theta}{\sqrt{1 - \sin^2 2\theta}} = \frac{\sin 2\theta}{\sqrt{\cos^2 2\theta}}$  \quad $\sin^2 2\theta + \cos^2 2\theta = 1$, so $1 - \sin^2 2\theta = \cos^2 2\theta$.

$= \frac{\sin 2\theta}{\cos 2\theta}$  \quad $\tan \theta = \frac{\sin \theta}{\cos \theta}$, so $\tan \theta = \tan 2\theta$.

$= \tan 2\theta$

Example 19

Show that $\frac{\cos^4 \theta - \sin^4 \theta}{\cos^2 \theta} = 1 - \tan^2 \theta$

When you have to prove an identity like this you may quote the basic identities like $\sin^2 \theta + \cos^2 \theta = 1$.

LHS $= \frac{\cos^4 \theta - \sin^4 \theta}{\cos^2 \theta}$

Usually the best strategy is to start with the more complicated side (here the left-hand side, LHS) and try to produce the expression on the other side.

$= \frac{(\cos^2 \theta + \sin^2 \theta)(\cos^2 \theta - \sin^2 \theta)}{\cos^2 \theta}$

The numerator can be factorised as the ‘difference of two squares’.

$= \frac{(\cos^2 \theta - \sin^2 \theta)}{\cos^2 \theta}$

$= \cos^2 \theta - \sin^2 \theta$

$= \cos^2 \theta \cdot \sin^2 \theta$

$= 1 - \tan^2 \theta = \text{RHS}$

$= \sin^2 \theta = \frac{1}{\cos^2 \theta}$  \quad $\cos^2 \theta = \frac{1}{\cos^2 \theta}$  \quad $\tan^2 \theta = \frac{\sin^2 \theta}{\cos^2 \theta} = \tan^2 \theta$. 
Example 20

a Use the formulae for $\sin(A + B)$ and $\cos(A + B)$ to prove that

$$\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}$$

b Hence show that $\tan(A - B) = \frac{\tan A - \tan B}{1 + \tan A \tan B}$

$$\tan(A + B) = \frac{\sin(A + B)}{\cos(A + B)} = \frac{\sin A \cos B + \cos A \sin B}{\cos A \cos B - \sin A \sin B}$$

Dividing the ‘top and bottom’ by $\cos A \cos B$ gives

$$\frac{\frac{\sin A \cos B}{\cos A \cos B} + \frac{\cos A \sin B}{\cos A \cos B}}{1 - \frac{\sin A \sin B}{\cos A \cos B}} = \frac{\tan A + \tan B}{1 - \tan A \tan B}$$

Cancel terms, as shown, and use the result $\tan \theta = \frac{\sin \theta}{\cos \theta}$

b Replace $B$ by $-B$ in the result above:

$$\tan(A - B) = \frac{\tan A + \tan(-B)}{1 - \tan A \tan(-B)} = \frac{\tan A - \tan B}{1 + \tan A \tan B}$$

Use the result $\tan(-\theta) = -\tan \theta$ which can be seen from the graph in section 10.4.

Example 21

Show, using the formula for $\sin(A - B)$, that $\sin 15^\circ = \frac{\sqrt{6} - \sqrt{2}}{4}$

$$\sin 15^\circ = \sin(45^\circ - 30^\circ)$$

$$= \sin 45^\circ \cos 30^\circ - \cos 45^\circ \sin 30^\circ$$

$$= \left(\frac{\sqrt{2}}{2}\right)\left(\frac{\sqrt{3}}{2}\right) - \left(\frac{\sqrt{2}}{2}\right)\left(\frac{1}{2}\right)$$

$$= \frac{1}{4}(\sqrt{3}\sqrt{2} - \sqrt{2})$$

$$= \frac{1}{4}(\sqrt{6} - \sqrt{2})$$

You know the exact form of $\sin$ and $\cos$ for many angles, e.g. $30^\circ, 45^\circ, 60^\circ, 90^\circ, 180^\circ...$, so write $15^\circ$ using two of these angles.

[You could equally use $\sin(60 - 45^\circ)$.]  

Example 22

Given that $2 \sin(x + y) = 3 \cos(x - y)$, express $\tan x$ in terms of $\tan y$.

Expanding $\sin(x + y)$ and $\cos(x - y)$ gives

$$2 \sin x \cos y + 2 \cos x \sin y$$

$$= 3 \cos x \cos y + 3 \sin x \sin y$$

so

$$\frac{2 \sin x \cos y}{\cos x \cos y} + \frac{2 \cos x \sin y}{\cos x \cos y}$$

$$= \frac{3 \cos x \cos y}{\cos x \cos y} + \frac{3 \sin x \sin y}{\cos x \cos y}$$

This is similar to the expression seen in deriving $\tan(A + B)$. A good strategy is to divide both sides by $\cos x \cos y$.  

181
\[
2 \tan x + 2 \tan y = 3 + 3 \tan x \tan y \\
2 \tan x - 3 \tan x \tan y = 3 - 2 \tan y \\
\tan x(2 - 3 \tan y) = 3 - 2 \tan y \\
\text{Collect all terms in } \tan x \text{ on one side.} \\
\text{Factorise.} \\
\text{So } \tan x = \frac{3 - 2 \tan y}{2 - 3 \tan y}
\]

**Exercise 10G**

1. Simplify each of the following expressions:
   
   \[\begin{array}{ccc}
   a & 1 - \cos^2 \frac{1}{2} \theta & b & 5 \sin^2 3 \theta + 5 \cos^2 3 \theta & c & \sin^2 A - 1 \\
   d & \frac{\sin \theta}{\tan \theta} & e & \frac{\sqrt{1 - \cos^2 x}}{\cos x} & f & \frac{\sqrt{1 - \cos^2 3A}}{\sqrt{1 - \sin^2 3A}} \\
   g & (1 + \sin x)^2 + (1 - \sin x)^2 + 2 \cos^2 x & h & \sin^4 \theta + \sin^2 \theta \cos^2 \theta & i & \sin^4 \theta + 2 \sin^2 \theta \cos^2 \theta + \cos^4 \theta \\
   \end{array}\]

2. Using the identities \(\sin^2 A + \cos^2 A = 1\) and/or \(\tan A = \frac{\sin A}{\cos A}\) (\(A \neq 0\)), prove that:
   
   \[\begin{array}{ccc}
   a & (\sin \theta + \cos \theta)^2 = 1 + 2 \sin \theta \cos \theta \\
   b & \frac{1}{\cos \theta} - \cos \theta = \sin \theta \tan \theta \\
   c & \tan x + \frac{1}{\tan x} = \frac{1}{\sin x \cos x} \\
   d & \cos^2 A - \sin^2 A = 2 \cos^2 A - 1 = 1 - 2 \sin^2 A \\
   e & (2 \sin \theta - \cos \theta)^2 + (\sin \theta + 2 \cos \theta)^2 = 5 \\
   f & 2 - (\sin \theta - \cos \theta)^2 = (\sin \theta + \cos \theta)^2 \\
   g & \sin^2 x \cos^2 y - \cos^2 x \sin^2 y = \sin^2 x - \sin^2 y \\
   \end{array}\]

3. Express the following as a single sine, cosine or tangent:
   
   \[\begin{array}{ccc}
   a & \sin 15^\circ \cos 20^\circ + \cos 15^\circ \sin 20^\circ & b & \sin 58^\circ \cos 23^\circ - \cos 58^\circ \sin 23^\circ \\
   c & \cos 130^\circ \cos 80^\circ - \sin 130^\circ \sin 80^\circ & d & \tan 76^\circ - \tan 45^\circ \\
   e & \cos \theta \cos 2\theta + \sin 2\theta \sin \theta & f & \cos 40^\circ \cos 3\theta - \sin 40^\circ \sin 3\theta \\
   g & \sin \frac{1}{2} \theta \cos \frac{3}{2} \theta + \cos \frac{1}{2} \theta \sin \frac{3}{2} \theta & h & \frac{\tan 2\theta + \tan 3\theta}{1 - \tan 2\theta \tan 3\theta} \\
   i & \sin(A + B) \cos B - \cos(A + B) \sin B & j & \cos \left(\frac{3x + 2y}{2}\right) \cos \left(\frac{3x - 2y}{2}\right) - \sin \left(\frac{3x + 2y}{2}\right) \sin \left(\frac{3x - 2y}{2}\right) \\
   \end{array}\]

4. Calculate, without using your calculator, the exact value of:
   
   \[\begin{array}{ccc}
   a & \sin 30^\circ \cos 60^\circ + \cos 30^\circ \sin 60^\circ & b & \cos 110^\circ \cos 20^\circ + \sin 110^\circ \sin 20^\circ \\
   c & \sin 33^\circ \cos 27^\circ + \cos 33^\circ \sin 27^\circ & d & \cos \frac{\pi}{8} \cos \frac{\pi}{8} - \sin \frac{\pi}{8} \sin \frac{\pi}{8} \\
   e & \sin 60^\circ \cos 15^\circ - \cos 60^\circ \sin 15^\circ & f & \cos 70^\circ \cos 50^\circ - \tan 70^\circ \sin 50^\circ \\
   \end{array}\]
\[
\begin{align*}
g & \quad \frac{\tan 45^\circ + \tan 15^\circ}{1 - \tan 45^\circ \tan 15^\circ} \\
i & \quad \frac{\tan \left(\frac{7\pi}{12}\right) - \tan \left(\frac{\pi}{3}\right)}{1 + \tan \left(\frac{7\pi}{12}\right) \tan \left(\frac{\pi}{3}\right)} \\
h & \quad \frac{1 - \tan 15^\circ}{1 + \tan 15^\circ} \\
j & \quad \sqrt{3} \cos 15^\circ - \sin 15^\circ \\
hint & \quad \tan 45^\circ = 1. \\
j & \quad \text{Look at e.}
\end{align*}
\]

5. Prove the identities:
\begin{align*}
a & \quad \sin(A + 60^\circ) + \sin(A - 60^\circ) = \sin A \\
c & \quad \frac{\sin(x + y)}{\cos x \cos y} = \tan x + \tan y \\
d & \quad \cos \left(\theta + \frac{\pi}{3}\right) + \sqrt{3} \sin \theta = \sin \left(\theta + \frac{\pi}{6}\right)
\end{align*}

10.8 You can solve simple trigonometric equations.

You can use your calculator to find a solution to an equation such as
\[\sin \theta = 0.4\]
giving \[\theta = 23.6^\circ\]

In section 10.4 you saw that there are other possible solutions to this equation namely:
\[\theta = 180^\circ - 23.6^\circ = 156.4^\circ\] or \[\theta = 23.6^\circ + 360^\circ = 383.6^\circ\] and so on.

The following table summarises the situation:

<table>
<thead>
<tr>
<th>Equation</th>
<th>1st Solution (calc)</th>
<th>2nd Solution</th>
<th>3rd Solution</th>
<th>4th Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\sin x = k)</td>
<td>(a)</td>
<td>(180 - a)</td>
<td>All cases are (a \pm 360)</td>
<td>All cases are 2nd sol. (\pm 360)</td>
</tr>
<tr>
<td>(\cos x = k)</td>
<td>(a)</td>
<td>(360 - a)</td>
<td>(a \pm 360)</td>
<td>(a \pm 360)</td>
</tr>
<tr>
<td>(\tan x = k)</td>
<td>(a)</td>
<td>(180 + a)</td>
<td>(a \pm 360)</td>
<td>(a \pm 360)</td>
</tr>
</tbody>
</table>

The shaded column is the key part to learn.

**Example 23**

Solve, in the interval \(0 \leq x < 360\), giving your answers to the nearest degree.

\(\text{a} \quad \sin x^\circ = 0.5\)
\(\text{b} \quad 4 \sin x^\circ = -3\)
\(\text{c} \quad 2 \tan x^\circ + 1 = 0\)

\(\text{a} \quad \sin x^\circ = 0.5\)
so \(x = 30\)
or \(x = 180 - 30 = 150\)
So \(x = 30^\circ\) or \(150^\circ\)

Using a calculator.

Using the formula in the table.
Example 24

Solve, in the interval $0 \leq x < 360^\circ$, giving your answers to 1 decimal place.

\[ \text{a} \quad \cos(x - 25)^\circ = 0.4 \quad \text{b} \quad \tan 2x^\circ = 3 \]

\[ \text{a} \quad \cos(x - 25)^\circ = 0.4 \]
Let $y = x - 25$ then
\[ y = 66.4 \]
or
\[ y = 360 - 66.4 = 293.6 \]
so
\[ x - 25 = 66.4 \text{ or } 293.6 \]
so
\[ x = 91.4^\circ \text{ or } 318.6^\circ \]

\[ \text{b} \quad \tan 2x^\circ = 3 \]
Let $y = 2x$ then
\[ y = 71.6, 251.6, 431.6, 611.6 \]
so
\[ x = 35.8, 125.8, 215.8, 305.8 \]

**NB** An equation of the form $\tan x = k$ usually has 2 solutions in the interval $(0, 360)$ and so an equation of the form $\tan 2x = k$ will usually have $2 \times 2 = 4$ solutions in this interval.

Sometimes you may have to work in radians.
Example 25

Solve \( 2 \cos 2x + 1 = 0 \) for \( -\pi < x \leq \pi \).

Give your answers as multiples of \( \pi \).

\[
2 \cos 2x + 1 = 0 \\
\text{so} \quad \cos 2x = -\frac{1}{2} \\
\text{so} \quad 2x = \frac{2\pi}{3} \quad \text{or} \quad 2x = \frac{4\pi}{3} \quad \text{or} \quad 2x = \frac{2\pi}{3} - 2\pi \quad \text{or} \quad \left(2\pi - \frac{2\pi}{3}\right) - 2\pi
\]

Using a calculator in degree mode gives 120°
which is easily converted into \( \frac{2\pi}{3} \) radians.

\[
2x = \frac{2\pi}{3} \cdot \frac{4\pi}{3}, \quad -\frac{4\pi}{3}, \quad -\frac{2\pi}{3} \quad \text{Use the formulae for} \\
2\text{nd, 3rd and 4th solutions from the table.}
\]

and \( x = \frac{\pi}{3}, \quad -\frac{2\pi}{3} \quad \text{or} \quad -\frac{\pi}{3} \quad \text{Finally divide by 2 to get } x. \)

You may have obtained these solutions more quickly by noticing that if \( \cos y = -\frac{1}{2} \)
then \( y = \pm \frac{2\pi}{3} \) or \( \pm \frac{4\pi}{3} \) from the graph in Section 10.4.

Exercise 10H

1. Solve the following equations for \( \theta \) in the interval \( 0 < \theta \leq 360^\circ \):
   a. \( \sin \theta = -1 \)  
   b. \( \tan \theta = \sqrt{3} \)
   c. \( \cos \theta = \frac{1}{2} \)  
   d. \( \sin \theta = \sin 15^\circ \)
   e. \( \cos \theta = -\cos 40^\circ \)  
   f. \( \tan \theta = -1 \)
   g. \( \cos \theta = 0 \)  
   h. \( \sin \theta = -0.766 \)
   i. \( 7 \sin \theta = 5 \)  
   j. \( 2 \cos \theta = -\sqrt{2} \)

2. Solve the following equations for \( x \), giving your answers to 3 significant figures where appropriate, in the intervals indicated:
   a. \( \sin x^\circ = -\frac{\sqrt{3}}{2} \), \( -180 < x < 540 \)
   b. \( 2 \sin x^\circ = -0.3 \), \( -180 < x < 180 \)
   c. \( \cos x^\circ = -0.809 \), \( -180 < x < 180 \)
   d. \( \cos x^\circ = 0.84 \), \( -360 < x < 0 \)
   e. \( \tan x^\circ = \frac{\sqrt{3}}{3} \), \( 0 \leq x < 720 \)
   f. \( \tan x^\circ = 2.90 \), \( 80 < x < 440 \)

3. Solve, in the intervals indicated, the following equations for \( \theta \), where \( \theta \) is measured in radians. Give your answer in terms of \( \pi \) or 2 decimal places.
   a. \( \sin \theta = 0 \), \( -2\pi < \theta \leq 2\pi \)
   b. \( \cos \theta = -\frac{1}{2} \), \( -2\pi < \theta \leq \pi \)
   c. \( \sin \theta = \frac{1}{\sqrt{2}} \), \( -2\pi < \theta \leq \pi \)
   d. \( 2(1 + \tan \theta) = 1 - 5 \tan \theta \), \( -\pi < \theta < 2\pi \)
4 Find the values of \( \theta \), in the interval \( 0 \leq \theta \leq 360^\circ \), for which:

\[
\begin{align*}
\text{a } & \quad \sin 4\theta = 0 \\
\text{b } & \quad \cos 3\theta = -1 \\
\text{c } & \quad \tan 2\theta = 1 \\
\text{d } & \quad \cos 2\theta = \frac{1}{2} \\
\text{e } & \quad \tan \frac{1}{2}\theta = -\frac{1}{\sqrt{3}} \\
\text{f } & \quad \sin (-\theta) = \frac{1}{\sqrt{2}} \\
\text{g } & \quad \tan (45^\circ - \theta) = -1 \\
\text{h } & \quad 2 \sin (\theta - 20^\circ) = 1 \\
\text{i } & \quad \tan (\theta + 75^\circ) = \sqrt{3}
\end{align*}
\]

5 Solve, in the intervals indicated, the following equations for \( \theta \), where \( \theta \) is measured in radians. Give your answer in terms of \( \pi \) or 2 decimal places.

\[
\begin{align*}
\text{a } & \quad \sin \theta = 0, -2\pi < \theta \leq 2\pi \\
\text{b } & \quad \sin \theta = \tan \theta, 0 < \theta \leq 2\pi
\end{align*}
\]

10.9 You can use trigonometric formulae to solve equations.

**Example 26**

Solve the following equations for \( 0 \leq x < 360 \)

\[
\begin{align*}
\text{a } & \quad 2 \sin x = \tan x \\
\text{b } & \quad \sin^2(x - 30) = \frac{1}{2}
\end{align*}
\]

\[
\begin{align*}
\text{a } & \quad 2 \sin x = \frac{\sin x}{\cos x} \\
& \quad 2 \sin x \cos x = \sin x \\
& \quad 2 \sin x \cos x - \sin x = 0 \\
& \quad \sin x(2 \cos x - 1) = 0 \\
& \quad \text{so } \sin x = 0 \quad \Rightarrow x = 0, 180 \\
& \quad \text{or } \cos x = \frac{1}{2} \quad \Rightarrow x = 60, 300 \\
& \quad \text{Find all the solutions using the formulae to find second solutions.} \\
& \quad \text{NB Some students “cancel” } \sin x \text{ at the “factorise” stage and they will lose the answer 0 and 180.} \\
& \quad \text{Cancelling should be avoided – factorise instead.}
\end{align*}
\]

\[
\begin{align*}
\text{b } & \quad \sin^2(x - 30) = \frac{1}{2} \\
& \quad \sin(x - 30) = \pm \frac{1}{\sqrt{2}}
\end{align*}
\]

\[
\begin{align*}
& \quad \text{Consider both cases separately, remembering } \\
& \quad \sin 45 = \frac{1}{\sqrt{2}} \text{ from section 10.4.} \\
& \quad \text{so } x = 75, 165 \\
& \quad \text{Solve for } x - 30 \text{ and then add 30 to get } x. \\
& \quad -\frac{1}{\sqrt{2}} \text{ gives } x - 30 = -45; 180 - 45; -45 + 360 \\
& \quad \text{so } x = (-15), 255, 345 \\
& \quad \text{Since the first solution is outside} \\
& \quad \text{the range you will need the second} \\
& \quad \text{and third solutions in this case.}
\end{align*}
\]

Sometimes you may have to solve a quadratic equation.
Example 27

Find the values of \(x\), in the interval \(-\pi < x < \pi\), satisfying the equation.

\[2 \cos^2 x + 9 \sin x = 3 \sin^2 x\]

Give your answers in radians correct to 3 significant figures.

\[
\begin{align*}
2 \cos^2 x + 9 \sin x &= 3 \sin^2 x \\
2(1 - \sin^2 x) + 9 \sin x &= 3 \sin^2 x \\
2 - 2 \sin^2 x + 9 \sin x &= 3 \sin^2 x \\
0 &= 5 \sin^2 x - 9 \sin x - 2 \\
0 &= (5 \sin x + 1)(\sin x - 2) \\
\end{align*}
\]

Since the equation has a \(\sin x\) term you can use \(\cos^2 x + \sin^2 x = 1\) to replace \(\cos^2 x\) with \(1 - \sin^2 x\).

This is a quadratic in \(\sin x\).

\[
\sin x = 2 \text{ or } -\frac{1}{5}
\]

\[
\sin x = -\frac{1}{5} \Rightarrow x = -0.20135...
\]

Factorise.

\[\sin x = 2 \text{ has no solutions.}\]

Use a calculator in “rad” mode to get

or \(x = \pi - 0.20135... = 3.342...\) (outside range) 1st solution, and the formula for 2nd.

or \(x = 3.342 - 2\pi = -2.940\)

To find further solutions you need to consider

\(-0.201 \pm 2\pi\) and \(3.342 \pm 2\pi\) selecting values in range.

Exercise 101

1. Solve the following equations for \(\theta\), in the interval \(0 < \theta < 360^\circ\):
   \[\begin{align*}
a & \quad \sqrt{3} \sin \theta = \cos \theta \\
b & \quad \sin \theta + \cos \theta = 0
\end{align*}\]

2. Solve, in the intervals indicated, the following equations for \(\theta\), where \(\theta\) is measured in radians. Give your answer in terms of \(\pi\) or 2 decimal places.
   \[\begin{align*}
a & \quad \sin \theta = \tan \theta, 0 < \theta < 2\pi \\
b & \quad 2 \cos \theta = 3 \sin \theta, 0 < \theta < 2\pi
\end{align*}\]

3. Solve for \(\theta\), in the interval \(0 \leq \theta \leq 360^\circ\), the following equations.
   Give your answers to 3 significant figures where they are not exact.
   \[\begin{align*}
a & \quad 4 \cos^2 \theta = 1 \\
b & \quad 3 \sin^2 \theta + \sin \theta = 0 \\
c & \quad 2 \cos^2 \theta - 5 \cos \theta + 2 = 0 \\
d & \quad \tan^2 2\theta = 3 \\
e & \quad \sin \theta + 2 \cos^2 \theta + 1 = 0 \\
f & \quad 3 \sin^2 \theta = \sin \theta \cos \theta \\
g & \quad 4 \cos^2 \theta - 5 \sin \theta = 5 = 0
\end{align*}\]

4. Solve for \(x\), in the interval \(0 \leq x \leq 2\pi\), the following equations.
   Give your answers to 3 significant figures unless they can be written in the form \(\frac{a}{\pi}\), where \(a\) and \(b\) are integers.
   \[\begin{align*}
a & \quad 2 \sin^2 \left(x + \frac{\pi}{3}\right) = 1 \\
b & \quad 6 \sin^2 x + \cos x - 4 = 0 \\
c & \quad \cos^2 x - 6 \sin x = 5
\end{align*}\]
Mixed Exercise 10J

1. Simplify the following expressions:
   a. \(\cos^4 \theta - \sin^4 \theta\)
   b. \(\sin^2 3\theta - \sin^2 3\theta \cos^2 3\theta\)
   c. \(\cos^4 \theta + 2 \sin^2 \theta \cos^2 \theta + \sin^4 \theta\)

2. a. Given that \(2 (\sin x + 2 \cos x) = \sin x + 5 \cos x\), find the exact value of \(\tan x\).
   b. Given that \(\sin x \cos y + 3 \cos x \sin y = 2 \sin x \sin y - 4 \cos x \cos y\), express \(\tan y\) in terms of \(\tan x\).

3. Given that \(2 \sin 2\theta = \cos 2\theta\):
   a. show that \(\tan 2\theta = 0.5\).
   b. Hence find the value of \(\theta\), to one decimal place, in the interval \(0 \leq \theta < 360^\circ\) for which \(2 \sin 2\theta = \cos 2\theta\).

4. Find all the values of \(\theta\) in the interval \(0 \leq \theta < 360^\circ\) for which:
   a. \(\cos (\theta + 75)^\circ = 0.5\),
   b. \(\sin 2\theta^\circ = 0.7\), giving your answers to one decimal place.

5. Find, giving your answers in terms of \(\pi\), all values of \(\theta\) in the interval \(0 < \theta < 2\pi\), for which:
   a. \(\tan \left(\theta + \frac{\pi}{3}\right) = 1\)
   b. \(\sin 2\theta = -\frac{\sqrt{3}}{2}\)

6. Find, in degrees, the values of \(\theta\) in the interval \(0 \leq \theta < 360^\circ\) for which
   \[2 \cos^2 \theta - \cos \theta - 1 = \sin^2 \theta\]
   Give your answers to 1 decimal place, where appropriate.

7. Solve the following equation in the interval given in brackets:
   \[\sin 3\theta \cos 2\theta = \sin 2\theta \cos 3\theta\] \(\{0 \leq \theta \leq 2\pi\}\)

8. Without using calculus, find the maximum and minimum value of the following expressions. In each case give the smallest positive value of \(\theta\) at which each occurs.
   a. \(\sin \theta \cos 10^\circ - \cos \theta \sin 10^\circ\)
   b. \(\cos 30^\circ \cos \theta - \sin 30^\circ \sin \theta\)

9. a. Without using a calculator, find the values of:
   i. \(\sin 40^\circ \cos 10^\circ - \cos 40^\circ \sin 10^\circ\)
   ii. \(\frac{1}{\sqrt{2}} \cos 15^\circ - \frac{1}{\sqrt{2}} \sin 15^\circ\)
   iii. \(\frac{1 - \tan 15^\circ}{1 + \tan 15^\circ}\)

   b. Find, to 1 decimal place, the values of \(x\), \(0 \leq x \leq 360^\circ\), which satisfy the equation
   \[2 \sin x = \cos(x - 60^\circ)\]
1. The sine rule is
\[
\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \quad \text{or} \quad \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}
\]

2. The cosine rule is
\[
a^2 = b^2 + c^2 - 2bc \cos A \quad \text{or} \quad b^2 = a^2 + c^2 - 2ac \cos B
\]
\[
or \quad c^2 = a^2 + b^2 - 2ab \cos C
\]

3. You can find an unknown angle using a rearranged form of the cosine rule:
\[
\cos A = \frac{b^2 + c^2 - a^2}{2bc} \quad \text{or} \quad \cos B = \frac{a^2 + c^2 - b^2}{2ac} \quad \text{or} \quad \cos C = \frac{a^2 + b^2 - c^2}{2ab}
\]

4. You can find the area of a triangle using the formula
\[
\text{area} = \frac{1}{2}ab \sin C
\]
if you know the length of two sides (a and b) and the value of the angle C between them.

5. 1 radian = \(\frac{180^\circ}{\pi}\).

6. The length of an arc of a circle is \(l = r\theta\).

7. The area of a sector is \(A = \frac{1}{2}r^2\theta\).

8. The addition (or compound angle) formulae are
\[
\sin(A + B) = \sin A \cos B + \cos A \sin B
\]
\[
\cos(A + B) = \cos A \cos B - \sin A \sin B
\]
\[
\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}
\]
\[
\sin(A - B) = \sin A \cos B - \cos A \sin B
\]
\[
\cos(A - B) = \cos A \cos B + \sin A \sin B
\]
\[
\tan(A - B) = \frac{\tan A - \tan B}{1 + \tan A \tan B}
\]

9. \(\tan \theta = \frac{\sin \theta}{\cos \theta}\) (providing \(\cos \theta \neq 0\). When \(\tan \theta\) is not defined)

10. \(\sin^2 \theta + \cos^2 \theta = 1\)

11. A first solution of the equation \(\sin \alpha = k\) is your calculator value, \(\alpha = \sin^{-1} k\). A second solution is \((180^\circ - \alpha)\), or \((\pi - \alpha)\) if you are working in radians. Other solutions are found by adding or subtracting multiples of \(360^\circ\) or \(2\pi\) radians.

12. A first solution of the equation \(\cos \alpha = k\) is your calculator value of \(\alpha = \cos^{-1} k\). A second solution is \((360^\circ - \alpha)\), or \((2\pi - \alpha)\) if you are working in radians. Other solutions are found by adding or subtracting multiples of \(360^\circ\) or \(2\pi\) radians.

13. A first solution of the equation \(\tan \alpha = k\) is your calculator value \(\alpha = \tan^{-1} k\). A second solution is \((180^\circ + \alpha)\), or \((\pi + \alpha)\) if you are working in radians. Other solutions are found by adding or subtracting multiples of \(360^\circ\) or \(2\pi\) radians.
1 \( f(x) = 5x^2 - 25x + 3 \).

a Express \( f(x) \) in the form \( f(x) = A(x + B)^2 + C \), giving the values of the constants \( A \), \( B \) and \( C \).

b Write down the minimum value of \( f(x) \) and the value of \( x \) for which it occurs.

2 a On the same axes, sketch and label the graphs of the lines with equations

- \( 4y = 12 - 3x \),
- \( 3y = 12 - 4x \),
- \( y = 2 - x \).

b Show clearly the region for which \( 3y + 4x \leq 12 \), \( 4y + 3x \leq 12 \), \( y + x \geq 2 \), \( x \geq 0 \), \( y \geq 0 \).

3 The sum of the first \( n \) terms of an arithmetic series is \( \frac{5}{7}n^2 + \frac{7}{9}n \). Find

a the first term of the series,

b the common difference of the series,

c the 50th term of the series.

4 The finite region enclosed by the curve with equation \( y = 9 - x^2 \) and the \( x \)-axis is rotated through 360° about the \( x \)-axis. Find, to 3 significant figures, the volume of the solid generated.

5 The points \( P \), \( Q \) and \( R \) have coordinates \((2, 4)\), \((4, 8)\) and \((4, 0)\) respectively.

a Show that \( \triangle PQR \) is isosceles.

b Calculate the size of each angle of \( \triangle PQR \).

6

In the diagram, \( \overrightarrow{OA} = \mathbf{a} \) and \( \overrightarrow{OB} = \mathbf{b} \). The point \( D \) on \( OB \) is such that \( OD : OB = 1 : 4 \) and the point \( E \) divides \( DA \) in the ratio \( 1 : 2 \).

a Find, in terms of \( \mathbf{a} \) and \( \mathbf{b} \),

i \( \mathbf{AD} \),

ii \( \mathbf{OE} \),

iii \( \mathbf{BE} \).
The point $F$ lies on $OA$ such that $OF = \mu OA$. Given that $F$, $E$ and $B$ are collinear,

b find the value of $\mu$.

The point $G$ lies on $AB$ such that $AG = \lambda AB$. Given that $EG$ is parallel to $DB$,

c find the value of $\lambda$.

7 Use $\tan \theta = \frac{\sin \theta}{\cos \theta}$

a to show that $\frac{d}{d\theta} (\tan \theta) = \frac{1}{\cos^2 \theta}$.

b to solve, in degrees to one decimal place, the equation $5 \sin \theta = 7 \cos \theta$, $0 \leq \theta \leq 360^\circ$.

8 A particle $P$ moves in a straight line. Initially $P$ is at rest at a fixed point $O$ of the line. At time $t$ seconds after leaving $O$ the velocity, $v$ m/s, of $P$ is given by $v = 3t - t^2$.

Find the distance $P$ moves before coming to rest again.

9 The lengths of the sides of a triangle are in the ratios 3 : 5 : 7. Find, in degrees to 3 significant figures, the three angles of this triangle.

10 a Copy and complete the following table for $y = \frac{1}{2}e^x + 3$, giving your values to 2 decimal places.

<table>
<thead>
<tr>
<th>$x$</th>
<th>$-2$</th>
<th>$-1$</th>
<th>$0$</th>
<th>$1$</th>
<th>$2$</th>
<th>$3$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>3.07</td>
<td>3.5</td>
<td>4.36</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b Using a scale of 2 cm to 1 unit on the $x$-axis and 1 cm to 1 unit on the $y$-axis, draw the graph of $y = \frac{1}{2}e^x + 3$ for $-2 \leq x \leq 3$.

c Use your graph to estimate, to 2 significant figures, the solution of the equation $e^x = 10$, showing your method clearly.

d By drawing a straight line on your graph, estimate, to 1 decimal place, the solution of the equation $x = \ln \frac{4}{1 - x}$.

11 Find the first three terms in the expansion of $(x - \frac{3}{x})^6$ as a series of descending powers of $x$, simplifying each term as far as possible.

12 Given that the equation $(p - 6)x^2 + 4px - 4 = 0$ has no real roots, find the set of possible values of $p$.

13 a Show that $\sum_{r=1}^{n} r = \frac{n}{2} (n + 1)$.

b Show that $a^3 - (a - 1)^3 = 3a^2 - 3a + 1$.

c Hence show that $\sum_{r=1}^{n} \{r^3 - (r - 1)^3\} = 3 \sum_{r=1}^{n} r^2 - \frac{1}{2}(3n^2 + n)$.

d Show that $\sum_{r=1}^{n} \{r^3 - (r - 1)^3\} = n^3$.

e Hence deduce that $\sum_{r=1}^{n} r^3 = \frac{1}{4}n(n + 1)(2n + 1)$.
14  a  Find the coordinates of the points of intersection of the curve with equation 
    \( y = x^2 - 3x + 14 \) and the line with equation \( y = 5x - 1 \).
    
    b  Find the area of the finite region bounded by the curve and the line.

15

\[ V \]

\[ A \]

\[ D \]

\[ B \]

\[ C \]

The diagram shows a right pyramid with vertex \( V \) and square base \( ABCD \), of side 12 cm. The size of angle \( AUC \) is 90°.

a  Show that the height of the pyramid is \( 6\sqrt{2} \) cm.

b  Find, in cm, the length of \( VA \).

c  Find, in cm, the exact length of the perpendicular from \( D \) to \( VA \). Give your answer in the form \( p/\sqrt{q} \), where \( p \) and \( q \) are integers and \( q \) is prime.

Find, in degrees to 1 decimal place, the size of

d  the angle between the plane \( VAB \) and the base \( ABCD \),

e  the angle between the plane \( VAB \) and the plane \( VAD \).

16  Oil is dripping from a leaking pipe and forms a circular pool. Find an estimate of the percentage increase in the radius of the pool when the area has increased by \( x\% \), where \( x \) is small.

17  The line \( l \) passes through the points with coordinates \((5, 5)\) and \((11, 10)\).

a  Show that an equation for \( l \) is \( 6y = 5x + 5 \).

The curve \( C \) with equation \( xy = 5 \) intersects the line \( l \) in two points.

b  Find the coordinates of these two points.

The line \( L \) passes through \((1, 0)\) and is perpendicular to \( l \).

c  Find an equation for \( L \).

d  Show, using algebra, that \( L \) never meets \( C \).

18  Solve, to 3 significant figures, for \( 0 \leq \theta \leq \pi \).

a  \( (4 \sin \theta - 1)(2 \sin \theta + 5) = 0 \).

b  \( \tan(2\theta - \frac{\pi}{3}) = 2.4 \).

c  \( 9 \sin^2 \theta - 9 \cos \theta = 11 \).

19  Solve

a  \( \log_5 p = 4 \).

b  \( 2\log_8 8 + 3\log_8 m = 7 \).

c  Solve the equations \[ 5\log_6 16 - 2\log_6 y = 19 \\
                             3\log_6 16 - 4\log_6 y = 14 \]
20 Prove that the line with equation \( y = 2x + 12 \) is a tangent to the curve with equation \( y = 8 - 2x - x^2 \).

21 The lengths of the sides of a triangle are 4 cm, 5 cm and 6 cm. Find, in degrees to one decimal place, the size of the largest angle of the triangle.

22 Referred to a fixed origin \( O \), the position vectors of the points \( P \) and \( Q \) are \( (6i - 5j) \) and \( (10i + 3j) \) respectively. The midpoint of \( PQ \) is \( R \).
   a Find the position vector of \( R \).
   The midpoint of \( OP \) is \( S \).
   b Prove that \( SR \) is parallel to \( OQ \).

23 The region enclosed by the curve \( y = 2x^2 + 5 \), the \( x \)-axis, the \( y \)-axis and the line \( x = 3 \) is rotated through \( 360^\circ \) about the \( x \)-axis. Find, in terms of \( \pi \), the volume of the solid generated.

24 \[
\begin{align*}
\sin(A + B) &= \sin A \cos B + \cos A \sin B \\
\cos(A + B) &= \cos A \cos B - \sin A \sin B
\end{align*}
\]
   a Obtain an expression for \( \cos 2\theta \) in terms of \( \cos^2 \theta \).
   b Write down an expression for \( \sin 2\theta \) in terms of \( \sin \theta \) and \( \cos \theta \).
   c Show that \( \cos 3\theta = 4 \cos^3 \theta - 3 \cos \theta \).
   d Solve, for \( 0 < \theta < \pi \), the equation \( 9 \cos \theta - 12 \cos^3 \theta = 2 \), giving your answers to 3 significant figures.
   e Find \( \int_{0}^{\pi/2} (3 \cos^3 \theta + 2 \sin \theta) \, d\theta \).

25 The fourth term of an arithmetic series is four times the eighth term. The sum of the first four terms is 164. Find
   a the common difference of the series.
   b the first term of the series.
   The sum of the first \( n \) terms of the series is \( S_n \).
   c Find the greatest value of \( n \) for which \( S_n \) is positive.

26 a Find the coordinates of the points where the curve with equation \( y = x^2 - 3x + 6 \) meets the line with equation \( y = 4x - 4 \).
   b Find the set of values of \( x \) for which \( x^2 - 3x + 6 \geq 4x - 4 \).

27 The position vectors of points \( P \) and \( Q \) are \( (3i + 4j) \) and \( (2i - 7j) \) respectively, referred to a fixed origin \( O \). The point \( R \) divides \( PQ \) internally in the ratio 2 : 3.
   Find, in terms of \( i \) and \( j \).
   a \( \overrightarrow{PQ} \).
   b \( \overrightarrow{OR} \).

28 A right pyramid has a horizontal square base of side 16 cm. The length of each sloping edge is 30 cm. Calculate, in degrees to the nearest 0.1°, the size of the angle between a triangular face and the horizontal.
29 A water tank is in the shape of a right circular cylinder with no lid. The base of the cylinder is a circle of radius \( r \) cm and the height is \( h \) cm. The total external surface area of the tank is \( A \) cm\(^2\). The capacity of the tank is 50 000 \( \pi \) cm\(^3\).

a Show that \( A = \left( \frac{100 000}{r} + r^2 \right) \pi \).

b Find, to the nearest whole number, the minimum value of \( A \). Verify that the value you have found is a minimum.

30 Find the sum of all the integers from 5 to 195 inclusive which are not multiples of 5.

31 The sum of the first and third terms of a geometric series is 50. The sum of the second and third terms is 30.

a Find the two possible values of the common ratio of the series.

Given that the series is convergent.

b Find the least number of terms of the series for which the sum exceeds 79.9.

32 In \( \triangle ABC \), \( AB = 6.3 \) cm, \( BC = 4.6 \) cm and \( \angle BAC = 32^\circ \). Find, to one decimal place, the two possible sizes of \( \angle ACB \).

33 Solve the equation \( \log_2(2x + 3) - \log_2 x = 3 \).

34 The point \( P \) has coordinates \((-5,0)\) and the point \( Q \) has coordinates \((1, 12)\).

a Find an equation of the line \( l \) through \( Q \) which is perpendicular to \( PQ \).

The line \( l \) meets the \( x \)-axis at \( R \).

b Find the coordinates of \( R \).

The points \( P, Q \) and \( R \) lie on a circle.

c Write down the coordinates of the centre of the circle.

35 A particle \( P \) moves in a straight line. At time \( t \) seconds, the velocity, \( v \) m/s, of \( P \) is given by \( v = 5 - 2t + t^2 \). Find

a the acceleration, in m/s\(^2\), of \( P \) when \( t = 3 \).

b the distance, in metres, travelled by \( P \) in the interval \( 0 \leq t \leq 4 \).

36

(A diagram showing lines and points labeled as described in the problem.)
The diagram shows the curve \( C \) with equation \( y = x^2 - 6x + 11 \). The three points \( P, Q \) and \( R \) lie on \( C \). The point \( R \) has coordinates \((1, 6)\) and the gradient of \( C \) at \( R \) is \(-4\).

The line \( l_1 \) is the normal to the curve at \( R \).

- **a** Find an equation, with integer coefficients, for \( l_1 \).
- **b** Find an equation for \( l_2 \).

The line \( l_2 \) also passes through the points \( P \) and \( Q \).

- **c** Show that the coordinates of \( Q \) are \((5, 6)\) and find the coordinates of \( P \).

The lines \( l_1 \) and \( l_2 \) intersect at \( M \).

- **d** Find the \( y \)-coordinate of \( M \).

- **e** Find the area of the shaded region.

37 \( f(x) = x^3 - 5x^2 + px + q, \ p, q \in \mathbb{R} \).

Given that \((x - 2)\) and \((x - 3)\) are factors of \( f(x) \).

- **a** form a pair of simultaneous equations in \( p \) and \( q \).
- **b** find the value of \( p \) and the value of \( q \).
- **c** factorise \( f(x) \) completely.
- **d** sketch the curve with equation \( y = f(x) \).

The curve with equation \( y = f(x) \) meets the curve with equation \( y = x^3 \) in two points.

- **e** Find the \( x \)-coordinates of the two points of intersection.

- **f** Find the area of the finite region bounded by the curve with equation \( y = f(x) \), the curve with equation \( y = x^3 \) and the positive \( x \)-axis.

38

![Diagram of triangle ABC](image)

The diagram shows \( \triangle ABC \) with \( AB = 8 \text{ cm}, BC = 4 \text{ cm}, \angle ABD = \theta \) and \( \angle DBC = \phi \).

The mid-point of \( AC \) is \( D \). By considering \( \cos ADB \) and \( \cos BDC \), or otherwise.

- **a** show that \( AC = 4\sqrt{6} \text{ cm} \).

By considering the areas of \( \triangle ABC \) and \( \triangle DBC \), or otherwise.

- **b** show that \( \sin(\theta + \phi) = \sin \phi \).

- **c** Hence show that \( \theta + 2\phi = 180^\circ \).

39 A curve has equation \( 16y = x^2 \). The \( x \)-coordinate of point \( P \) of the curve is 12.

- **a** Find an equation, with integer coefficients, for the tangent to the curve at \( P \).
- **b** Find an equation, with integer coefficients, for the normal to the curve at \( P \).

The finite region bounded by the curve, the tangent at \( P \) and the \( y \)-axis is rotated through \( 360^\circ \) about the \( y \)-axis.

- **d** Find, in terms of \( \pi \), the volume of the solid generated.
40 a Expand \( (1 + \frac{x}{p})^4 \), where \( p \neq 0 \), in ascending powers of \( x \), up to and including the term in \( x^3 \), simplifying your terms as far as possible.

Given that the coefficient of \( x \) is twice the coefficient of \( x^3 \).

b find the possible values of \( p \).

41 A solid rectangular block has volume 486 cm\(^3\). The width of the block is \( x \) cm, the length is 3\( x \) cm and the height is \( h \) cm.

a Show that \( x^2 h = 162 \).

The total surface area of the block is \( A \) cm\(^2\).

b Show that \( A = 6x^2 + \frac{1296}{x} \).

c Find, to 3 significant figures, the value of \( x \) such that \( \frac{dA}{dx} = 0 \).

d Show that this value of \( x \) gives a minimum value of \( A \).

e Find, to 3 significant figures, the minimum value of \( A \).

42 a Show that \( \sum_{r=1}^{n} r = \frac{n(n + 1)}{2} \).

b Hence, or otherwise, find the sum of all the integers from 1 to 99 inclusive which are not multiples of 5.

43 a Expand \( (1 - 6x)^3 \) in ascending powers of \( x \), up to and including the term in \( x^3 \), simplifying each term.

b By substituting \( x = \frac{1}{27} \) into your expansion, obtain an approximation.

to 6 significant figures, for \( \sqrt[3]{2} \).

c Calculate the percentage error, to 2 significant figures, in the approximation obtained in part b.

Given that \( \frac{(1 - 6x)^3}{(1 + x)^3} = a + bx + cx^2 + ... \)

d find the values of \( a \), \( b \) and \( c \).

e state the range of values for \( x \) which the series \( a + bx + cx^2 + ... \) converges.

44 Find an equation, with integer coefficients, for the perpendicular bisector of the line joining the points (5, 9) and (11, -3).

45 The region enclosed by the curve with equation \( y = e^{2x} + 4 \), the \( x \)-axis, the \( y \)-axis and the line \( x = 2 \) is rotated through \( 360^\circ \) about the \( x \)-axis. Find, in terms of \( e \) and \( \pi \), the volume of the solid generated.

46 Using \( \cos(A + B) = \cos A \cos B - \sin A \sin B \).

a show that \( \cos^2 \theta = \frac{1}{2} (\cos 2\theta + 1) \).

\[ f(\theta) = 8 \cos^4 \theta - 4 \cos^2 \theta - 1. \]

b Show that \( f(\theta) = \cos 4\theta + 2 \cos 2\theta \).
c Solve the equation

\[ 8 \cos^4 \theta - 4 \cos^2 \theta - 2 \cos 2 \theta = 1.5, \text{ for } 0 \leq \theta \leq 180. \]

Given that \( \int_0^\frac{\pi}{2} f(\theta) d\theta = k/3. \)

d find the value of \( k. \)

47 A curve has equation \( y = 2 + \frac{1}{x^2 + 1}, x \neq -1. \)

a Find an equation of the asymptote to the curve which is parallel to
   i the \( x \)-axis, ii the \( y \)-axis.

b Find the coordinates of the points where the curve crosses the coordinate axes.

c Sketch the curve, showing clearly the asymptotes and the coordinates of the points
   where the curve crosses the coordinate axes.

48 A particle \( P \) moves in a straight line. At time \( t \) seconds, the velocity \( v \) m/s, of \( P \) is given by

\[ v = t^2 - 2t + 9. \]

Find

a the acceleration of \( P \), in m/s\(^2\), when \( t = 3. \)

b the distance \( P \) travels in the interval \( 0 \leq t \leq 6. \)

49

\[ O \quad P \quad A \quad Q \quad B \quad R \]

In the diagram \( \overline{OA} = a \) and \( \overline{OB} = b. \) The point \( P \) divides \( OA \) in the ratio 1 : 2, and \( Q \) is the

a Find \( \overline{PQ} \), in terms of \( a \) and \( b. \)

\( R \) is the point on \( AB \) produced such that \( OR = 2b - a. \)

b Find \( \overline{PR} \), in terms of \( a \) and \( b. \)

c Hence show that \( P, Q \) and \( R \) are collinear.

50 Differentiate with respect to \( x. \)

a \( y = 5x^2 \cos 3x. \)

b \( y = \frac{e^{3x}}{x^2 + 3}. \)

51 The volume of a right conical pile of sand is increasing at a constant rate of 0.75 m\(^3\)/s.

The height, \( h \) metres, of the cone is always equal to the diameter of the base of the cone.

Find, to 3 significant figures, the rate of increase of the radius of the base when \( h = 1.5. \)
52  In $\triangle ABC$, $AB = 2x$ cm, $BC = 5$ cm, $AC = (2x + 3)$ cm and $\angle BAC = 60^\circ$.
   a  Find, to 3 significant figures, the value of $x$.
   Using your value of $x$.
   b  Find, in degrees to 1 decimal place, the size of $\angle ACB$.

53  Find the set of values of $p$ for which the equation $x^2 + 2px + (10 - 3p) = 0$ has real, unequal roots.

54  a  Copy and complete the table for $y = 2x - \frac{1}{x^2}$, giving the values of $y$ to 3 significant figures where appropriate.

<table>
<thead>
<tr>
<th>$x$</th>
<th>0.5</th>
<th>1.0</th>
<th>1.5</th>
<th>2.0</th>
<th>2.5</th>
<th>3.0</th>
<th>3.5</th>
<th>4.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>-3</td>
<td>2.56</td>
<td>4.84</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>7.94</td>
</tr>
</tbody>
</table>

   b  Using a scale of 4 cm to 1 unit on the $x$-axis and 2 cm to 1 unit on the $y$-axis, draw the graph of $y = 2x - \frac{1}{x^2}$ for $0.5 \leq x \leq 4.0$.

   c  Express $2x - \frac{1}{x^2}$ as a single fraction, and hence use your graph to estimate.
   to 2 significant figures, the value of $\sqrt{0.5}$.

   d  By drawing a suitable straight line on your graph, find an estimate, to 2 significant figures, of the root of the equation $3x - 6 - \frac{1}{x^2} = 0$, in the interval $0.5 \leq x \leq 4.0$.

55  $f(x) = x^2 - 7x + 10$.
Given that $f(x)$ can be expressed in the form $(x + A)^2 + B$, where $A$ and $B$ are constants.
   a  Find the value of $A$ and the value of $B$.
   b  Hence, or otherwise, determine the value of $x$ for which $f(x)$ has its least value and state
   this least value.
   The curve $C$ has equation $y = x^2 - 7x + 10$. The line $l$ with equation $y = x + 3$ intersects
   the curve $C$ at two points.
   c  Find the coordinates of each of these two points.
   d  Find the coordinates of the points where the curve intersects the $x$-axis.
   e  Sketch, on the same axes, the curve $C$ and the line $l$.
   f  Find the area of the region bounded by the curve $C$, the line $l$ and the lines $x = 2$ and
   $x = 5$.

56  Solve the equations
   
   $y - 2x = 5$,
   
   $2x^2 + 2xy + y^2 = 5$.

57  $f(x) = 2x^2 + px - 6$.
The equation $f(x) = 0$ has roots $\alpha$ and $\beta$. Without solving the equation.
   a  find, in terms of $p$,
   i  $\alpha^2 + \beta^2$,
   ii  $\alpha^2 \beta^2$. 

198
Given that $\alpha - \beta = 4$.
b find the possible values of $p$.

Given that $p$ is positive:
c form an equation with roots $\alpha^2$ and $\beta^2$.

d 58 The third, fourth and fifth terms of a geometric series are $(5x - 9), (7x - 3)$ and $(12x + 4)$ respectively.
a Determine the two possible values of $x$.

Given that all the terms of the series are positive, find, for the series:
b the common ratio,
c the first term,
d the sum of the first 12 terms.

d 59 Differentiate, with respect to $x$.
a $y = (5x^2 - 2)e^{2x}$,
b $y = \frac{x^3 + 2}{x - x^2}$, simplifying your answer.

60 Find the exact solution of the equation
$$\frac{32}{e^x} - e^x = 4.$$

61 Triangle $LMN$ has $LM = 5$ cm, $LN = 8.2$ cm and $MN = 6.4$ cm. Calculate, in degrees to
the nearest 0.1°, the size of $\angle LMN$.

62 A curve has equation $y = 3x^2 - 7x + 5$. The point $P$ on the curve has $x$-coordinate 2.
The tangent and the normal to the curve at $P$ meet the $x$-axis at $A$ and $B$ respectively.
Find the area of $\triangle APB$.

63 a Expand $(1 + \frac{1}{3}x)^\frac{1}{2}$ in ascending powers of $x$, up to and including the term in $x^2$,
simplifying each term as far as possible.

b Expand $(1 - \frac{1}{3}x)^{-3}$ in ascending powers of $x$, up to and including the term in $x^2$,
simplifying each term as far as possible.

c State the range of values of $x$ for which both of your expansions are valid.

Using your answers to parts a and b.

d expand $(\frac{4 + x}{4 - x})^\frac{1}{3}$ in ascending powers of $x$, up to and including the term in $x^2$,
simplifying each term as far as possible.

e Hence obtain an estimate, to 3 significant figures, of $\int_{0}^{0.1} (\frac{4 + x}{4 - x})^\frac{1}{3} \, dx$.

64 Using the identities
$\cos (A + B) = \cos A \cos B - \sin A \sin B$
$\sin (A + B) = \sin A \cos B + \cos A \sin B$,
express
a $\cos 2A$ in terms of $\cos A$. 

b \quad \sin 2A \text{ in terms of } \sin A \text{ and } \cos A, \text{ simplifying your answer.}

c \quad \text{Hence show that } \cos 3A = 4 \cos^3 A - 3 \cos A.

d \quad \text{Solve, for } 0 \leq x \leq 180^\circ, \text{ the equation } 4 \cos^3 x - 3 \cos x = 0.6, \text{ giving your solutions to one decimal place.}

e \quad \text{Evaluate } \int_0^\pi \cos^3 \theta d\theta, \text{ giving your answer in the form } \frac{a}{b} \sqrt{c}, \text{ where } a, b \text{ and } c \text{ are integers.}

65 \quad \text{Find the coordinates of the points of intersection of the curve with equation } y = x^2 - 8x + 11 \text{ and the line with equation } x + y = 5.

66 \quad \text{a} \quad \text{Expand } (p + qx)^5, \text{ simplifying each term as far as possible.}
\quad \text{In the expansion of } (p + qx)^5, p \neq 0, q \neq 0, \text{ the coefficient of } x^4 \text{ is twice the coefficient of } x^2.
\quad \text{Also, when } x = 2, \text{ the value of } (p + qx)^5 \text{ is 7776.}
\quad \text{b} \quad \text{Find the possible pairs of values of } p \text{ and } q.

67 \quad \text{Solve the equation}
\quad \text{a} \quad \log_5 243 = 5.
\quad \text{b} \quad \log_4 (3q + 4) = 3.
\quad \quad \quad f(x) = 2x \log_5 3 - 5 \log_5 9 - x + 5
\quad \quad \quad \text{c} \quad \text{Find the value of } a \text{ and the value of } b \text{ so that } f(x) = (x - 5)(a \log_5 3 - b).
\quad \quad \quad \text{d} \quad \text{Hence solve the equation } f(x) = 0.

68 \quad \text{The points } A, B \text{ and } C \text{ have coordinates } (2, 6), (6, 8) \text{ and } (4, 2) \text{ respectively.}
\quad \text{a} \quad \text{Find the exact lengths of}
\quad \quad \quad \text{i} \quad AB,
\quad \quad \quad \text{ii} \quad BC,
\quad \quad \quad \text{iii} \quad AC.
\quad \text{b} \quad \text{Find the size of each angle of } \triangle ABC.
\quad \text{A circle is drawn to pass through the points } A, B \text{ and } C. \text{ Find}
\quad \text{c} \quad \text{the coordinates of the centre of the circle.}
\quad \text{d} \quad \text{the exact length of the radius of the circle.}

69 \quad \text{Solve, for } -180^\circ \leq \theta < 180^\circ, 6 \sin^2 \theta - 7 \cos \theta = 1

70 \quad \text{A right pyramid } ABCDE \text{ has a square base } ABCD \text{ of side } 5 \text{ cm. The height of the pyramid is } 6 \text{ cm. Find, in degrees to 1 decimal place, the angle between the plane } ABE \text{ and the base.}

71 \quad \text{The third and fifth terms of an arithmetic series are given by } \log pq^4 \text{ and } \log pq^8 \text{ respectively, } q \neq 1.
\quad \text{The common difference of the series is } b \log q, \text{ where } b \text{ is a constant. Find}
\quad \text{a} \quad \text{the value of } b.
\quad \text{b} \quad \text{the first term of the series.}
\quad \text{The sum of the first } n \text{ terms of the series can be written in the form } s \log pq^r.
\quad \text{c} \quad \text{Express } r \text{ and } s \text{ in terms of } n.
Given that the sum of the first 16 terms of the series is 10 times the sum of the first 4 terms of the series,

\(d\) show that \(\log p = 5 \log q\).

72 \( f(x) = 3x^2 - 6x + p. \)

The equation \(f(x) = 0\) has roots \(\alpha\) and \(\beta\). Without solving the equation \(f(x) = 0\),

a form a quadratic equation, with integer coefficients, which has roots \((\alpha + \beta)\) and \(\frac{1}{\alpha + \beta'}\).

b form a quadratic equation which has roots \(\frac{\alpha + \beta}{\alpha}\) and \(\frac{\alpha + \beta}{\beta}\).

Given that 3 is a root of the equation found in part b, find

c the value of \(p\).

\(d\) the other root of the equation.

73 Find the set of values of \(p\) for which the equation \(x^2 - 2px + (12 - p) = 0\) has no real roots.

(All questions © Edexcel Limited)
Revision tips and techniques

Revision tips
We all learn differently, so some of these revision tips will suit you and others may not. Try them out and see if they work for you.

Revision guidelines
- Start your revision early! You should start your revision at least three months before the International GCSE Further Pure Mathematics examinations.
- Plan your revision.
- Split the work into chunks.
- Go through the chunks to ensure you understand each piece of work. If you do not understand something, ask for help. You can ask your teacher or a friend who is also studying Further Pure Mathematics, but do not delay and hope the problem will go away. It won’t. You will never learn anything really well unless you understand it.
- Summarise the work in a form you can go through easily the next time.
- Ensure that you have completed the summarising of the entire course at least a month before your exams start.
- Go through each summary at least twice more, referring back to more detailed notes where necessary. You could summarise your summaries!
- Make your revision active – do not just sit and read the textbook or your notes. Find activities to make yourself think about what you are doing.
- Remember that your two exam papers will test your skills as well as your knowledge and understanding. Practising past exam questions will help you to make sure you know what the examiner wants you to do.

Revision aims
When you revise, you are trying to:

1. Improve your memory
   You are trying to increase your knowledge and understanding of mathematics, but your brain quickly forgets. Most of what you try to learn by heart you will forget over the next few days. Nevertheless, you can help your brain to remember by using different revision techniques.

2. Organise what you have studied
   If you organise what you have studied so that it all makes better sense, you will be able to remember more of it. You can organise it by linking together the main ideas. Remembering one idea will help you remember another.

3. Improve your understanding
   If you can improve your understanding of mathematics, you will find that your skills also improve.
Splitting the work into chunks

It is very much up to you how you do this. For example, you might like to split all of your Further Pure Mathematics work up according to the arrangement of your notes – the chunks in which you were taught. Or you might like to do it using groups of chapters in your textbook. Just doing this exercise will help you to learn, because it makes you think about the subject as a whole and how each part relates to other parts.

It is also worth making a list of individual topics with minimal detail under each heading: simply key words and key equations.

The process of doing these summaries is a really good way of getting your brain to think hard about what you need to know, which in itself is very useful revision. It’s much better than just learning things from a revision guide, where someone else has done the summarising.

How long should I spend revising?

You are far better off doing a sensible amount of quality revision rather than hour after hour of meaningless reading. Lots of people find they cannot concentrate for periods of much more than 20 minutes. If that is you, then take a short break every 20 minutes – make a cup of coffee or get some fresh air for a few minutes before going back to your work.

After about an hour and a half take a longer break of at least fifteen minutes, and do something completely different. Other people find they work best by settling down to concentrate for a longer period – say 45 minutes – when they think only about their work and nothing else, and then take a longer break.

If you have done the preparatory work described above, you should not need to spend hours cramming the night before. All you should need to do is a quick run through the basics and a check on anything that you are unsure of. That way, you can get to bed early and arrive at the examination room refreshed and ready to demonstrate your knowledge, skills and understanding.

Where should I do my revision?

Ideally you should have your own private space where you can work undisturbed. If you are unable to find your own private space, find somewhere without any immediate distractions (such as a television). Some people like to play music as they work – others don’t. If you do, make sure you are concentrating on your work, not the music!

Some important points to remember

- Make your revision active. You should always be doing something active to force your brain to work. Just staring at notes or the textbook is no good.
- Keep fit. Take exercise. Eat healthily. Take breaks to do things you enjoy. Try not to worry.

Revision techniques

You need to make your revision active. In order to break the course down into chunks that you can usefully revise, you really need to think about the subject material. When you come to summarise the chunks, you have to think about it again. By the time you are one month away from your examination, you should have already gone through the work at least twice. Now comes the intensive learning, so here are some suggestions to help you do this.
Sticky notes

Do you have difficulty remembering formulae? One way is to write the formulae on sticky notes (or small cards) and stick them on your bedroom or bathroom mirror, so that you see them every time you look in the mirror. If they are on your bathroom mirror, you can test yourself while you are brushing your teeth!

Answering practice questions

It is a good idea to answer practice questions on a topic when you revise it. You will need the help of your teacher to mark it and provide you with feedback very soon afterwards. It is also helpful, during the early part of the revision period, to work through some questions with your teacher to show you how to plan a good answer in the time allowed.

How to revise using this book

The topics in this book have been arranged in a logical sequence so you can work your way through them from beginning to end. However, how you work on them depends on how much time there is between now and your examination.

If you have plenty of time before the examination, you can work through each topic in turn, reading the examples and trying the questions from the mixed exercises.

If you are short of time, you should look at the summary of key points at the end of each chapter and then try some of the mixed exercise questions. However much time you have you should always allow some time to answer some past examination papers.

Make sure you break your revision into short blocks of about 40 minutes, separated by five- or ten-minute breaks. Nobody can study effectively for hours without a break.

Exam advice

In this section you will find some key points to watch out for in your Further Pure Mathematics exam. They are based on common errors made by students in the past.

Chapter 1
Make sure you know the rules of logarithms and apply them carefully.

Don’t make the classic error and write:

$$\log(x + 3) = \log x + \log 3$$

Chapter 3
When solving quadratic inequalities, remember to draw a sketch or use a table to make sure you get the correct interval.

Chapter 4
Make sure you know the graphs of the basic shapes.

Use a simple point on the graph to check you’ve not made a silly mistake (e.g. if $x = 1$ is $y$ positive or negative?).

Chapters 7 and 8
Remember that drawing a diagram often helps with vector questions and those involving coordinate geometry.
Chapter 9
i  Don’t confuse the rules for integration and differentiation.
ii  Don’t forget the $+c$ when integrating.
iii  Remember if you are differentiating $\sin x/3x$ it is not $\cos x/3$ but you must use the quotient rule.

Chapter 10
i  Always check the mode of your calculator for degrees or radians.
ii  Remember there is a special formula for $\sin(x + y)$ – it is not equal to $\sin x + \sin y$. 
You are expected to have an electronic calculator when answering these papers.

**Paper 1**

**Time: 2 hours**

1. In \( \triangle ABC \), \( AB = 5.7 \) cm, \( BC = 8.4 \) cm and \( \angle ACB \) is 42°.
   Find, to the nearest 0.1°, the two possible sizes of \( \angle BAC \).
   (Total 4 marks)

2. \( f(x) = x^3 + px^2 + qx - 36 \), \( p \) and \( q \) \( \in \mathbb{Z}^+ \)
   The three roots of the equation \( f(x) = 0 \) are \( \alpha, \beta \) and \( \gamma \), where \( \alpha \in \mathbb{Z}^+ \).
   a. Show that \( \alpha = 3 \)  
   (2 marks)
   b. Hence find the value of \( p \) and the value of \( q \).
   (Total 5 marks)

3. The volume of a sphere is increasing at a rate of 25 cm\(^3\)/s.
   Find the rate of increase of the surface area of the sphere when the radius is 2.5 cm.
   (Total 6 marks)

4. Solve the equations \( xy = 6 \), \( xy + x + y = 11 \)
   (Total 6 marks)

5. Relative to a fixed origin \( O \), the position vector of the point \( A \) is \( 3\mathbf{i} + 8\mathbf{j} \) and the position vector of the point \( B \) is \( 12\mathbf{i} + q\mathbf{j} \).
   The point \( C \) divides \( AB \) internally in the ratio \( 1 : 2 \) and \( \overrightarrow{OC} = p\mathbf{i} + 4\mathbf{j} \).
   a. Find the value of \( p \) and the value of \( q \).
   (5 marks)
   b. Find, in terms of \( \mathbf{i} \) and \( \mathbf{j} \), the position vector of \( M \).
   (Total 8 marks)
The figure shows the curve \( C_1 \) with equation \( y^2 = 8x + 4 \) and the curve \( C_2 \) with equation \( y^2 = 8 - 4x \).

The curves \( C_1 \) and \( C_2 \) intersect at the points \( A \) and \( B \).

a Find the exact coordinates of \( A \). \hspace{1cm} (3)

The shaded region enclosed by \( C_1 \), \( C_2 \) and the \( x \)-axis is rotated through 360° about the \( x \)-axis.

b Find, in terms of \( \pi \), the volume of the solid generated. \hspace{1cm} (6)

(Total 9 marks)

7 The sum, \( S_n \), of the first \( n \) terms of an arithmetic series is given by \( S_n = \frac{n}{4} (13 + 7n) \).

Find

a the first term of the series. \hspace{1cm} (1)

b the \( n \)th term of the series. \hspace{1cm} (3)

c the common difference of the series. \hspace{1cm} (2)

The \( p \)th term of the series is a multiple of the first term.

b Given that \( p \neq 1 \), find the least value of \( p \). \hspace{1cm} (3)

(Total 9 marks)

8 a Expand fully \((a + bx)^6\), simplifying each term as far as possible. \hspace{1cm} (4)

In the expansion of \((a + bx)^6\), \( a \neq 0 \), \( b \neq 0 \), the coefficient of \( x^3 \) is twice the coefficient of \( x^1 \). When \( x = 3 \) the value of \((a + bx)^6\) is 46 656.

b Find the possible pairs of values of \( a \) and \( b \). \hspace{1cm} (6)

(Total 10 marks)

9 Solve the equation

a \( \log_2 125 = 3 \) \hspace{1cm} (2)

b \( \log_4 (9y + 4) = 4 \) \hspace{1cm} (3)

c \( 3 - \log_3 p = \log_3 9 \) \hspace{1cm} (6)

(Total 11 marks)

10 The curve \( C_1 \), with equation \( y = x^2 \), meets the curve \( C_2 \), with equation \( y = \frac{x^2}{x - 1} \), at the origin and at the point \( A \).

Find

a the coordinates of \( A \). \hspace{1cm} (4)

b an equation of the tangent to \( C_1 \) at \( A \). \hspace{1cm} (4)

c an equation of the tangent to \( C_2 \) at \( A \). \hspace{1cm} (4)

The tangent to \( C_1 \) at \( A \) meets the \( y \)-axis at the point \( B \) and the tangent to \( C_2 \) at \( A \) meets the \( y \)-axis at the point \( D \).

d Find the area of \( \triangle BAD \). \hspace{1cm} (3)

(Total 15 marks)
The figure shows a solid $VABCDEFGH$ which consists of a cuboid $ABCD\!\!EFGH$ and a right pyramid $VABCD$.

$AB = 5\; \text{cm}$, $BC = 12\; \text{cm}$, $EC = 17\; \text{cm}$.

The height of the pyramid is $10\; \text{cm}$.

Calculate, in cm to 3 significant figures, the length of

a  $AE$.  

b  $VA$.  

Find, in degrees to the nearest $0.1^\circ$, the size of the angle between

C  $EC$ and the plane $ABCD$.  

d  the plane $VAB$ and the plane $ABGH$.  

e  the plane $VAB$ and the plane $VCD$.  

(Total 17 marks)
Paper 2
Time: 2 hours

1. Differentiate with respect to \( x \), \( e^{2x} \sin 3x \). (Total 3 marks)

2. In \( \triangle ABC \), \( AB = 5 \text{ cm} \), \( BC = 8.3 \text{ cm} \) and \( AC = 6.9 \text{ cm} \).
   a. Find, in degrees, to the nearest 0.1°, the size of \( \angle ACB \). (Total 3 marks)
   b. Find, in cm\(^2\), to 3 significant figures, the area of \( \triangle ABC \). (Total 6 marks)

3. A curve has equation \( y = 3 - \frac{2}{x - 2}, x \neq 2 \)
   a. Write down an equation of the asymptote to the curve which is parallel to
      i. the \( x \)-axis, ii. the \( y \)-axis. (2 marks)
   b. Calculate the coordinates of the point where the curve crosses
      i. the \( x \)-axis, ii. the \( y \)-axis. (2 marks)
   c. Sketch the curve, showing clearly the asymptotes and the coordinates of the
      points where the curve crosses the coordinate axes. (Total 7 marks)

4. a. Copy and complete the table for \( y = e^x - 4x^2 \), giving your values of \( y \) to 3 significant figures.

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>0.5</th>

</table>

   b. Draw the graph of \( y = e^x - 4x^2 \) for \( 0 \leq x \leq 4 \). (2 marks)
   c. For each of the following equations, use your graph to obtain an estimate, to one
      decimal place, for the root between \( x = 0 \) and \( x = 4 \)
      i. \( x^2 = \frac{1}{4}e^x + 2 \)
      ii. \( x = \ln(4x^2 - 3) \) (Total 9 marks)

5. A particle moves along a straight line.
   At time \( t \) seconds the velocity, \( v \text{ ms}^{-1} \), of the particle is given by \( v = t^3 - 7t^2 + 12t, t \geq 0 \)
   a. Find the values of \( t \) for which the particle is instantaneously at rest. (3 marks)
   b. Sketch the graph of \( v = t^3 - 7t^2 + 12t, t \geq 0 \). (2 marks)
   c. Find, to 3 significant figures, the total distance travelled by the particle in the
      interval \( 0 \leq t \leq 4 \). (4 marks)

6. The sum to infinity of a convergent geometric series is \( 80x, x > 0 \), and the sum of
   the first four terms is \( 75x \).
   a. Find the possible values of the common ratio of the series. (4 marks)
Given that the first term of the series is greater than 100x.

b find, in terms of \(x\), the first term of the series. \((3)\)

Given that the fifth term of the series is 30

c find the value of \(x\). \((3)\)

(Total 10 marks)

7 The curve with equation \(y = 4e^{2x}\) meets the curve with equation \(y = (e^{2x} - 3)^2\) at the points \(A\) and \(B\).

a Find the coordinates of \(A\) and the coordinates of \(B\). \((6)\)

b Find, to 4 significant figures, the length of \(AB\). \((2)\)

The point \(C\) has coordinates \((5, 0)\).

c Find, to 3 significant figures, the area of \(\triangle ABC\). \((4)\)

(Total 12 marks)

8 A solid metal cube of side 5 cm is melted down and all the metal is used to make a right cylinder.
The radius of the cylinder is \(r\) cm and the height is \(h\) cm.
The total surface area of the cylinder is \(A\) cm\(^2\).

a Show that \(A = \frac{250}{r} + 2\pi r^2\) \((4)\)

b Find, to 3 significant figures, the value of \(r\) for which \(\frac{dA}{dr} = 0\). \((3)\)

c Show that the value of \(r\) found in part \(b\) gives a minimum value of \(A\). \((3)\)

d Find, to 3 significant figures, the minimum value of \(A\). \((2)\)

(Total 12 marks)

9 a Show that \((\alpha + \beta)(\alpha^2 - \alpha\beta + \beta^2) = \alpha^3 + \beta^3\)

\((\alpha - \beta)(\alpha^2 + \alpha\beta + \beta^2) = \alpha^3 - \beta^3\) \((3)\)

\(f(x) = x^2 + 7x + 3, x \in \mathbb{R}\)
The equation \(f(x) = 0\) has roots \(\alpha\) and \(\beta\) where \(\alpha > \beta\). Without solving the equation, calculate the value of

b \(\alpha^3 + \beta^3\). \((3)\)

c \((\alpha - \beta)^2\). \((2)\)

Hence

d calculate the exact value of \(\alpha^3 - \beta^3\). \((3)\)

e form a quadratic equation, with integer coefficients, with roots \(\frac{\alpha}{\beta^2}\) and \(\frac{\beta}{\alpha^2}\). \((4)\)

(Total 15 marks)

10 \(\sin(A + B) = \sin A \cos B + \cos A \sin B\),

\(\cos(A + B) = \cos A \cos B - \sin A \sin B\).

a By writing \(\tan(A + B) = \frac{\sin(A + B)}{\cos(A + B)}\), prove that \(\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}\). \((3)\)
b  Hence or otherwise, find the exact value of
   i  $\tan 75^\circ$.
   ii  $\tan 15^\circ$.
   simplifying your answers as far as possible.  \hspace{1cm} (5)

  c  Use the result in a to write down an expression for $\tan 2\theta$ in terms of $\tan \theta$.  \hspace{1cm} (1)

  d  Hence find the exact value of $\tan 22.5^\circ$.  \hspace{1cm} (4)

Given that $\tan \theta = \frac{1}{2}$ and $\theta$ is an acute angle.

  e  find the exact value of $\sin 2\theta$.  \hspace{1cm} (4)

(Total 17 marks)

TOTAL FOR PAPER: 100 MARKS

(All questions © Edexcel Limited)
Appendix: Formulae, notation and symbols

This appendix gives formulae that students are expected to remember and will not be included on the examination paper.

**Logarithmic functions and indices**

\[
\log_a(xy) = \log_a x + \log_a y \\
\log_a \left(\frac{x}{y}\right) = \log_a x - \log_a y \\
\log_a x^k = k \log_a x \\
\log_a \frac{1}{x} = -\log_a x \\
\log_a a = 1 \\
\log_a x = \frac{\log_b x}{\log_b a} \\
\log_a 1 = 0 \\
\log_a b = \frac{1}{\log_b a}
\]

**Quadratic equations**

\[ax^2 + bx + c = 0\] has roots given by

\[x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}\]

When the roots of \(ax^2 + bx + c = 0\) are \(\alpha\) and \(\beta\) then \(\alpha + \beta = -\frac{b}{a}\) and \(\alpha\beta = \frac{c}{a}\)

and the equation can be written \(x^2 - (\alpha + \beta)x + \alpha\beta = 0\)

**Series**

**Arithmetic series:**  \(n\)th term = \(a + (n - 1)d\)

Sum to \(n\) terms = \(\frac{n}{2} \{2a + (n - 1)d\}\)

**Geometric series:**  \(n\)th term = \(ar^{n-1}\)

Sum to \(n\) terms = \(\frac{a(r^n - 1)}{r - 1}\)

Sum to infinity = \(\frac{a}{1 - r}\) \(|r| < 1\)

**Binomial series**

For \(|x| < 1, n \in \mathbb{Q}\)

\[(1 + x)^n = 1 + nx + \frac{n(n - 1)}{2!}x^2 + \ldots + \frac{n(n - 1)\ldots(n - r + 1)}{r!}x^r + \ldots\]
Coordinate geometry

The gradient of the line joining two points \((x_1, y_1)\) and \((x_2, y_2)\) is \(\frac{y_2 - y_1}{x_2 - x_1}\).

The distance \(d\) between two points \((x_1, y_1)\) and \((x_2, y_2)\) is given by
\[
d^2 = (x_1 - y_1)^2 + (x_2 - y_2)^2
\]

The coordinates of the point dividing the line joining \((x_1, y_1)\) and \((x_2, y_2)\) in the ratio \(m:n\) are \(
\left(\frac{mx_1 + nx_2}{m + n}, \frac{my_1 + ny_2}{m + n}\right)
\)

Calculus

**Differentiation:**

<table>
<thead>

**Area and volume:**

Area between a curve and the \(x\) axis is \(\int_a^b y\,dx\), \(y \geq 0\)
\[
\left|\int_a^b y\,dx\right|, y \leq 0
\]

Area between a curve and the \(y\) axis is \(\int_c^d x\,dy\), \(x \geq 0\)
\[
\left|\int_c^d x\,dy\right|, x \leq 0
\]

Area between \(g(x)\) and \(f(x)\) is \(\int_a^b |g(x) - f(x)|\,dx\)

Volume of revolution = \(\int_a^b \pi y^2\,dx\) or \(\int_c^d \pi x^2\,dy\)
**Trigonometry**

Radian measure:
- length of arc = \( r\theta \)
- area of sector = \( \frac{1}{2} r^2 \theta \)

In triangle \( ABC \):
- \( \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \)
- \( a^2 = b^2 + c^2 - 2bc \cos A \)
- \( \cos^2 \theta + \sin^2 \theta = 1 \)
- area of a triangle = \( \frac{1}{2}ab \sin C \)

**Notation**

\( \mathbb{N} \)
- the set of positive integers and zero, \( \{0, 1, 2, 3, \ldots\} \)

\( \mathbb{Z} \)
- the set of integers, \( \{0, \pm 1, \pm 2, \pm 3, \ldots\} \)

\( \mathbb{Z}^+ \)
- the set of positive integers, \( \{1, 2, 3, \ldots\} \)

\( \mathbb{Q} \)
- the set of rational numbers

\( \mathbb{Q}^+ \)
- the set of positive rational numbers \( \{x: x \in \mathbb{Q}, x > 0\} \)

\( \mathbb{R} \)
- the set of real numbers

\( \mathbb{R}^+ \)
- the set of positive real numbers \( \{x: x \in \mathbb{R}, x > 0\} \)

\( \mathbb{R}^+_0 \)
- the set of positive real numbers and zero \( \{x: x \in \mathbb{R}, x \geq 0\} \)

\( |x| \)
- the modulus of \( x \), \( |x| = \begin{cases} x & \text{for } x \geq 0 \\ -x & \text{for } x < 0 \end{cases} \)

\( \approx \)
- is approximately equal to

\[ \sum_{r=1}^{n} f(r) = f(1) + f(2) + \ldots + f(n) \]

\[ \binom{n}{r} \]
- the binomial coefficient \( \frac{n!}{r!(n-r)!} \) for \( n \in \mathbb{Z}^+ \)

\( \ln x \)
- the natural logarithm of \( x \), \( \log_e x \)

\( \lg x \)
- the common logarithm of \( x \), \( \log_{10} x \)

\( f'(x), f''(x), f'''(x) \)
- the first, second and third derivatives of \( f(x) \) with respect to \( x \)

\( |a| \)
- the magnitude of \( a \)

\( |AB| \)
- the magnitude of \( \overline{AB} \)

5  $(x + 8)(x - 5)$  7  $(x + 2)(x + 3)$  
9  $(x - 5)(x + 2)$  11  $(2x + 1)(x + 2)$  
13  $(5x - 1)(x - 3)$  15  $(2x - 3)(x + 5)$  
17  $(x + 2)(x - 2)$  19  $(2x + 5)(2x - 5)$  
21  $(4(3x + 1))(3x - 1)$  23  $(2(3x - 2))(x - 1)$  

2.2
Exercise 2B

1  $(x + 2)^2 - 4$  3  $(x - 8)^2 - 64$  
5  $(x - 7)^2 - 49$  7  $(3x - 4)^2 - 48$  
9  $5(x + 2)^2 - 20$  11  $3(x + \frac{1}{2})^2 - \frac{27}{4}$  

2.3

Exercise 2C

1 \( x = 0 \) or \( x = 4 \)
2 \( x = 1 \) or \( x = -1 \)
3 \( x = 0 \) or \( x = 2 \)
4 \( x = 3 \)
5 \( x = -1 \) or \( x = -2 \)
6 \( x = -5 \) or \( x = -2 \)
7 \( x = 6 \) or \( x = -1 \)
8 \( x = -\frac{1}{2} \) or \( x = -3 \)
9 \( x = 13 \) or \( x = 1 \)
10 \( x = -1 \) or \( x = 1 \)
11 \( x = -\frac{1}{2} \) or \( x = \frac{1}{2} \)
12 \( x = 1 \) or \( x = -1 \)
13 \( x = 1 \) or \( x = 2 \)
14 \( x = 1 \) or \( x = -2 \)
15 \( x = 1 \) or \( x = 2 \)
16 \( x = 1 \) or \( x = -1 \)
17 \( x = 1 \) or \( x = 2 \)
18 \( x = 1 \) or \( x = -1 \)
19 \( x = 1 \) or \( x = 2 \)
20 \( x = 1 \) or \( x = -1 \)
21 \( x = 1 \) or \( x = 2 \)
22 \( x = 1 \) or \( x = -1 \)
23 \( x = 1 \) or \( x = 2 \)
24 \( x = 1 \) or \( x = -1 \)
25 \( x = 1 \) or \( x = -1 \)
26 \( x = 1 \) or \( x = -1 \)
27 \( x = 1 \) or \( x = -1 \)
28 \( x = 1 \) or \( x = -1 \)
29 \( x = 1 \) or \( x = -1 \)
30 \( x = 1 \) or \( x = -1 \)
31 \( x = 1 \) or \( x = -1 \)
32 \( x = 1 \) or \( x = -1 \)
33 \( x = 1 \) or \( x = -1 \)
34 \( x = 1 \) or \( x = -1 \)
35 \( x = 1 \) or \( x = -1 \)

2.4

Exercise 2D

1 \( x = 1 \)
2 \( x = 3.56 \) or \( -0.562 \)
3 \( x = 0.781 \) or \( -1.28 \)
4 \( x = 1.37 \) or \( -1.70 \)
5 \( x = -3 \) or \( -2.62 \)
6 \( x = -3 \) or \( -2.62 \)
7 \( x = -3 \) or \( -2.62 \)
8 \( x = -3 \) or \( -2.62 \)
9 \( x = -3 \) or \( -2.62 \)
10 \( x = -3 \) or \( -2.62 \)
11 \( x = -3 \) or \( -2.62 \)
12 \( x = -3 \) or \( -2.62 \)
13 \( x = -3 \) or \( -2.62 \)
14 \( x = -3 \) or \( -2.62 \)
15 \( x = -3 \) or \( -2.62 \)
16 \( x = -3 \) or \( -2.62 \)
17 \( x = -3 \) or \( -2.62 \)
18 \( x = -3 \) or \( -2.62 \)
19 \( x = -3 \) or \( -2.62 \)
20 \( x = -3 \) or \( -2.62 \)
21 \( x = -3 \) or \( -2.62 \)
22 \( x = -3 \) or \( -2.62 \)
23 \( x = -3 \) or \( -2.62 \)
24 \( x = -3 \) or \( -2.62 \)
25 \( x = -3 \) or \( -2.62 \)
26 \( x = -3 \) or \( -2.62 \)
27 \( x = -3 \) or \( -2.62 \)
28 \( x = -3 \) or \( -2.62 \)
29 \( x = -3 \) or \( -2.62 \)
30 \( x = -3 \) or \( -2.62 \)
31 \( x = -3 \) or \( -2.62 \)
32 \( x = -3 \) or \( -2.62 \)
33 \( x = -3 \) or \( -2.62 \)
34 \( x = -3 \) or \( -2.62 \)
35 \( x = -3 \) or \( -2.62 \)

2.5

Exercise 2E

1 \( a : x^2 + 8x - 1 = 0 \)
2 \( b : x^2 - 6x + 8 = 0 \)
3 \( a : x^2 - 5x + 9 = 0 \)
4 \( b : x^2 + 5x + 1 = 0 \)

Mixed Exercise 2F

1 \( a : x(3x + 4) \)
2 \( b : 2y(2y + 5) \)
3 \( c : x(x + y + y^2) \)
4 \( d : 2xy(4y + 5x) \)
5 \( a : y = -1 \) or \( -2 \)
6 \( b : x = \frac{1}{3} \) or \( -5 \)
7 \( c : x = -\frac{1}{3} \) or \( 3 \)
8 \( d : 5 \) or \( \frac{\sqrt{7}}{2} \)

3.1

Exercise 3A

1 \( a : x^2 + 5x + 3 \)
2 \( b : x^2 + x - 9 \)
3 \( c : x^2 - 3x + 7 \)
4 \( d : x^2 - 3x + 2 \)
5 \( e : x^2 - 3x - 2 \)

3.2

Exercise 3B

1 \( (x - 1)(x + 3)(x + 4) \)
2 \( (x + 1)(x + 7)(x - 5) \)
3 \( (x - 2)(2x - 1)(x + 4) \)
4 \( (x - 1)(2x + 1)(x + 3) \)
5 \( (x - 3)(2x - 1)(x - 5) \)
6 \( (x + 1)(3x - 1)(x + 2) \)
7 \( (x - 2)(3x - 1)(2x + 1) \)
8 \( (x - 2)(2x + 3)(2x - 5) \)

3.3

Exercise 3C

1 \( a : 27 \)
2 \( b : 6 \)
3 \( c : 0 \)
4 \( d : 1 \)

3.4

Exercise 3D

1 \( a : x = 5, y = 6 \) or \( x = 6, y = 5 \)
2 \( b : x = 0, y = 1 \) or \( x = \frac{1}{2}, y = -\frac{1}{2} \)
3 \( c : x = -1, y = -3 \) or \( x = 1, y = 3 \)
4 \( d : x = 4, y = 4 \) or \( x = 6, y = 3 \)
5 \( e : a = 1, b = 5 \) or \( a = 3, b = -1 \)
6 \( f : u = 1, v = 4 \) or \( u = 2, v = 3 \)

Chapter 3

Exercise 3A

1 \( a : x^2 + 5x + 3 \)
2 \( b : x^2 + x - 9 \)
3 \( c : x^2 - 3x + 7 \)
4 \( d : x^2 - 3x + 2 \)
5 \( e : x^2 - 3x - 2 \)

Exercise 3B

1 \( (x - 1)(x + 3)(x + 4) \)
2 \( (x + 1)(x + 7)(x - 5) \)
3 \( (x - 2)(2x - 1)(x + 4) \)
4 \( (x - 1)(2x + 1)(x + 3) \)
5 \( (x - 3)(2x - 1)(x - 5) \)
6 \( (x + 1)(3x - 1)(x + 2) \)
7 \( (x - 2)(3x - 1)(2x + 1) \)
8 \( (x - 2)(2x + 3)(2x - 5) \)

Exercise 3C

1 \( a : 27 \)
2 \( b : -6 \)
3 \( c : 0 \)
4 \( d : 1 \)

Exercise 3D

1 \( a : x = 5, y = 6 \) or \( x = 6, y = 5 \)
2 \( b : x = 0, y = 1 \) or \( x = \frac{1}{2}, y = -\frac{1}{2} \)
3 \( c : x = -1, y = -3 \) or \( x = 1, y = 3 \)
4 \( d : x = 4, y = 4 \) or \( x = 6, y = 3 \)
5 \( e : a = 1, b = 5 \) or \( a = 3, b = -1 \)
6 \( f : u = 1, v = 4 \) or \( u = 2, v = 3 \)
3.5 Exercise 3E

1 a $x < 4$  
   b $x \geq 7$  
   c $x > 2\frac{1}{2}$  
   d $x < -3$  
   e $x < 11$  
   f $x < 2\frac{1}{2}$  
   g $x > -12$  
   h $x < 1$  
   i $x \leq 8$  
   j $x > \frac{1}{2}$

3 a $x > 2\frac{1}{2}$  
   b $2 < x < 4$  
   c $2\frac{1}{2} < x < 3$
   d No values  
   e $x = 4$

3.6 Exercise 3F

1 a $3 < x < 8$  
   b $-4 < x < 3$  
   c $x < -2, x > 5$  
   d $x \leq -4, x \geq -3$  
   e $-\frac{1}{2} < x < 7$  
   f $x < -2, x > 2\frac{1}{2}$  
   g $\frac{1}{2} < x < 1\frac{1}{2}$  
   h $x < \frac{1}{3}, x > 2$
   i $-3 < x < 3$  
   j $x < -2\frac{1}{2}, x > \frac{5}{3}$  
   k $x < 0, x > 5$
   l $-1\frac{1}{2} < x < 0$

3.7 Exercise 3G

1 $-3 \leq x \leq 4$
   3 $2y + x \geq 10$ or $2y + x \leq 4$
   5 $4x + 3y \leq 12, y \geq 0$ and $y \leq 2x + 4$

10.5
Exercise 10E

1. a \( x = 84, y = 6.32 \)  b \( x = 13.5, y = 16.6 \)  c \( x = 85, y = 13.9 \)  d \( x = 80, y = 6.22 \) (Isosceles \( \Delta \) )  e \( x = 6.27, y = 7.16 \)  f \( x = 4.49, y = 7.49 \) (right-angled)
3  a  x = 74.6, y = 65.4
    x = 105, y = 34.6
    b  x = 59.8, y = 48.4
    x = 120, y = 27.3
    c  x = 56.8, y = 4.37
    x = 23.2, y = 2.06

5  a  108°, 1°
    b  90°
    c  60°
    d  52.6°
    e  137°
    f  72.2°

7  a  155°
    b  13.7 cm

9  6.50 cm²

10.6
Exercise 10F

1  a  11.7 cm
    b  14.2 cm
    c  34.4°
    d  63.4°

3  a  14.1 cm
    b  17.3 cm
    c  35.4°

5  a  4.47 m
    b  4.58 m
    c  29.2°
    d  12.6°
    e  26.6°

7  a  43.3 cm
    b  68.7 cm
    c  81.2 cm
    d  71.6°

9  a  16.2 cm
    b  67.9°
    c  55.3 cm²

11  a  30.3°
    b  31.6°
    c  68.9°

13  a  15 m
    b  47.7°

15  46.5 m

10.7
Exercise 10G

1  a  \[\sin^2 \theta \]
    b  5
    c  -cos^2 A
    d  cos \theta
    e  tan x
    f  tan 3A
    g  4
    h  sin^2 \theta
    i  1

3  a  sin 35°
    b  sin 35°
    c  cos 210°
    d  tan 31°
    e  cos \theta
    f  cos 7\theta
    g  sin 3\theta
    h  tan 5\theta
    i  sin A

j  cos 3x

5  a  L.H.S. = sin A cos 60° + cos A sin 60°
    + sin A cos 60° - cos A sin 60°
    = 2 sin A cos 60°
    = 2 sin A (\frac{1}{2}) = sin A = R.H.S.

    b  L.H.S. = \frac{\cos A \cos B - \sin A \sin B}{\sin B \cos B} = \frac{\cos (A + B)}{\sin B \cos B}
    = R.H.S.

    c  L.H.S. = \frac{\sin x \cos y + \cos x \sin y}{\cos x \cos y}
    = \frac{\sin x \cos y}{\cos x \cos y} + \frac{\cos x \sin y}{\cos x \cos y}
    = \tan x + \tan y = R.H.S.

10.8
Exercise 10H

1  a  270°
    b  60°, 240°
    c  60°, 300°
    d  15°, 165°
    e  140°, 220°
    f  135°, 315°
    g  90°, 270°
    h  230°, 310°
    i  45.6°, 134.4°

3  a  -\pi, 0, \pi, 2\pi
    b  -\frac{4\pi}{3}, -\frac{2\pi}{3}, \frac{2\pi}{3}
    c  -\frac{7\pi}{4}, -\frac{5\pi}{4}, \frac{3\pi}{4}

5  a  -\frac{\pi}{12}, \frac{\pi}{12}

10.9
Exercise 10I

1  a  30°, 210°
    b  135°, 315°

3  a  60°, 120°, 240°, 300°
    b  0°, 180°, 199°, 341°, 360°
    c  60°, 300°
    d  30°, 60°, 120°, 150°, 210°, 240°, 300°, 330°
    e  270°
    f  0°, 18.4°, 180°, 198°, 360°
    g  194°, 270°, 346°

Mixed Exercise 10J

1  a  \cos^2 \theta \sin^2 \theta
    b  \sin^4 \theta
    c  1

3  a  2 sin 2\theta = \cos 2\theta \Rightarrow 2 sin 2\theta / \cos 2\theta = 1
    \Rightarrow 2 \sin \theta = 1 \Rightarrow \sin 2\theta = 0.5
    b  13.3, 103.3, 193.3, 283.3
Review exercise

1. \( A = 5, B = -\frac{5}{2}, C = -28\frac{1}{4} \)

| **Z**                |                |
| **zero vector**      | 98 |
This is Edexcel's own course for the latest specification of International GCSE Further Pure Mathematics. This book is designed to provide you with the best preparation possible for your examinations:

- Written by highly experienced Mathematics teachers.
- Clear, engaging style that students will find easy to understand.
- Includes clear diagrams, hint boxes, all formulae needed for the examinations, worked examples and chapter summaries.
- Exam preparation material throughout, with a review exercise, revision and examination guidance and practice examination papers in the back of the book.
